Report Generator

Powerful Business Intelligence Solution

Monitor, analyse and project your
business' performance

The Report Generator is a powerful business intelligence solution designed to extract and analyse data from Streets Heaver's applications. A stand-alone system, it enables you to report on any data with ease that previously only a data warehouse could offer.

Key features of Report Generator include:

- Create reports from multiple databases
- Design and deploy reports in seconds
- Define unlimited columns, groupings and data filters
- Decide who can view and edit individual reports by assigning group and user privileges
- SQL Direct feature to create custom ad-hoc reports
- Access data in a variety of formats including HTML, Excel, CSV and PDF

Simple to use and easy to learn

Creating a report is easy using the intuitive report wizard which guides you step-by-step through setting up reports using selectable columns, groupings and filters.

Each user can categorise reports by adding relevant keywords in the form of tags, making it easier to find the report at a later date.

Reports can be organised into libraries, such as month end reports which can then all be run at the click of a button.

Pivot table functionality

Once a report has been run, the interactive pivot table provides additional flexibility to manipulate and view your data in a variety of ways.

This is simply achieved by dragging and dropping columns and groupings to different positions to expand or summarise your data.

Benefits of Report Generator include:

- Analyse real-time information on performance and profitability
- Design dashboards to monitor management KPIs
- Support management to make informed business decisions
- Improve the speed and accuracy of forecasting
- Save time by scheduling automatic report delivery by email

High level of security

Each user's login is authenticated by Windows Server Active Directory, providing fully integrated security and making it easy to administer group policies and permissions. Security roles within the application specify which users can run, view, amend or delete reports whilst an audit log is maintained of all user activity.

Boardroom ready reports

Highly customisable, reports can be printed using the pre-defined templates or can be personalised to include logos, charts and graphs.
