Heritage Bollards

Watts HERITAGE Bollards are manufactured from engineering grade polymer – Ultrathane, cast onto a central steel core. A highly versatile material, in a cast iron finish, Ultrathane can be used to create or preserve the traditional Victorian theme.

The durability of Urethane makes it a preferred material in the specification of street furniture. It will not rust or corrode and is resistant to many chemicals including saline and uric acid. It is also chip and highly abrasion resistant. This gives Ultrathane products a longer, maintenance-free life span and helps to reduce ongoing costs.

Applications include walkways, car parks, shopping centres, town centres, warehouses, quaysides, demarcation – in fact anywhere with a requirement to prohibit / restrict the use of vehicles within a given area for the safety of pedestrians and property.

A wide range of standard generic designs are available and Ultrathane easily replicates existing cast iron products. Finished in a high quality polyurethane paint, Watts Heritage bollards require very little additional maintenance after installation. All bollards have a steel core that provides significant impact resistance to vehicular impacts and can be specified with a full anti-ram specification or removable with socket.

Ultrathane bollards are available in a number of BS standard colour references plus bespoke RAL colours. Class 1 traffic tape is available for all Heritage bollards as an option. Lift-out and removable versions are available for all products along with chain rings or adaptation to post and rail systems.

The full range of Watts HERITAGE Bollards can be found on our website:
