Different sizes are available on request, if what you want is not here please contact us direct on 0121 271 0047

The above Flights are usually mounted, laterally to the top surface of the belt in various widths and pitches to form a 'spillage free area' especially when installed in conjunction with longitudinal Sidewalls.

When material is loaded onto the belt it is effectively contained within a 'pocket' formed by the Sidewalls and the lateral flights and is therefore prevented from falling back or escaping laterally, so eliminating spillage, but more importantly, as the Sidewalls form part of the belt there is none of the wear normally associated with side skirts. This simple design ensures material remains within the belt's effective carrying area.

Differing styles of flight are available including cantilever and angled, for more information and a detailed explanation of what is available please do not hesitate to contact one of our technical staff.

All White and Blue materials are generally FDA approved (please consult *Stevens Belting Limited* for confirmation).

^{a1} All data provided are approximate values under 'normal climatic conditions' 20 deg C / 50% humidity. Lower temperatures will dictate a larger drum diameter requirement.

For detailed material properties and other colours, please contact *Stevens Belting Limited*.
