

Hydra-Valve

Penstock Valves

Project Location: Bledington

End Customer: Thames Water

Project Description

Four 12" Penstock Valves were all seized in various positions at a Sewage Treatment Works.

Due to the isolations required and the time the site would have to be out of service to replace these valves it was deemed that another solution was required.

Hydra-Valve personnel were approached for a solution to this problem and in a very short time a team was mobilised.

The equipment used was the HVL-VR Valve Operation System. This tooling was able to engage with the valve and release the valves from their seized position.

The valves were then cycled and received in situ maintenance to bring them back to a fully serviceable condition.

The valves were handed over to the customer who had saved £1000's of pounds in isolations, plant shut down and asset acquisition.
