

What is Cloud Computing?

Cloud computing is the practice of using a network of remote servers hosted on the internet to store, manage and process data, rather than on a local server or a personal computer.

Why move over to a Cloud Server

What can Keyfort do for you?

- We are able to do an automatic back up from your office and move and integrate applications to the Keyfort Cloud Services.
- We will also give you personalised training with planning and assistance and comprehensive support.

- Reduced Costs- companies no longer need to maintain physical infrastructure.
- Cloud Servers are fast and expandable, which meets business requirements as they grow.
- The cloud servers reside in UK based data centres that are ISO 270091 compliant.
- The cloud serves are up through back-up batteries, so if the internet went down, the cloud would still be up and running. This is known as an 'auto-fail-over', meaning you will ALWAYS have access to your business' sensitive data.
- It is easy to set up for remote working, meaning that you are able to work away from your office and still; access all business' data.
