

Buoy

Instructions

The Buoy Unit is a table or wall-mounted security product which can protect various hand-held devices. It features a retractable coiled cable which enables the user to handle the device itself – the unit is supplied without the head attachment – various heads are available for different applications.

Operation

The Buoy Unit should firstly be secured to your display area either by means of the three self-adhesive pads supplied or via the two self-tapping screws in the base. Screw covers are supplied if you prefer to cover these once the unit is secured. A template is also provided with these instructions to detail the location of the self-adhesive pads or screws.

To attach a head to the Buoy Unit – remove the black plastic cable restraint, hold the cable and insert the transparent plug into the socket on the head. Ensure this clicks securely into place. The head itself is magnetised and will drop immediately into its upright position.

To protect your hand-held device simply peel the protective cover from the adhesive pad (dependent upon type of head purchased) and attach the head to your device.

Once the head is attached correctly, plug the end of the cable into the stereo adaptor lead provided, this in turn plugs directly into your alarm track.

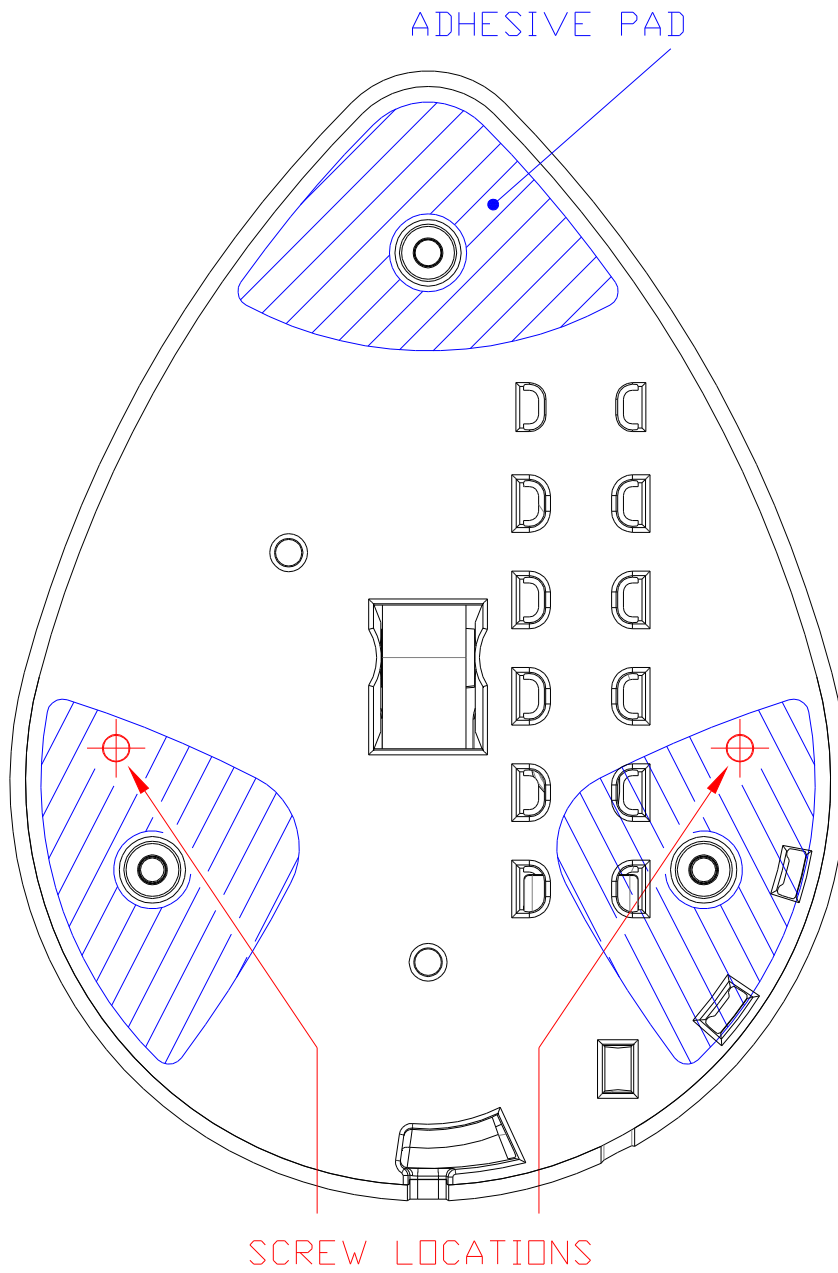

If the alarm is triggered, the red LED in the base will illuminate to indicate which device is at risk. Follow the instructions for the Sygma 2 for deactivation.

Box Contents:

- 1 x Buoy Unit
- 3 x Adhesive Washers
- 2 x Self-Tapping Screws
- 3 x Screw Covers
- 1 x Stereo Adaptor Lead
