# Desktop Backup

Modern Networks desktop backup service protects the valuable data stored on your PC from loss due to fire, theft, accidental damage or hacking. Multiple copies of your data are stored automatically in different locations to ensure it's always recoverable.

Users often store critical data on their laptops. However, mobile staff and remote workers are not always connected to and protected by the corporate network. Our desktop backup ensures that your users' data is securely backed-up offsite. So, if the worst does happen, users can quickly and easily recover their files, anytime, anywhere.

Delivery

Please contact a member of the sales team to quote for this service.

Terms of service

Typical subscriptions have a 12-month term and licenses are available within 24-48 hours.
