

MANN+HUMMEL Filters for Compressors

**Draft
Version**
April 2015

MANN+HUMMEL Filters for compressors

The production processes of today depend on compressed air as a flexible and easy to handle source of energy. Almost all known industrial products are manufactured, packed or transported using compressed air systems which in turn require compressors.

Modern manufacturing and processing methods make high demands on the safety, function, reliability and economy of compressors and compressed air systems. The costs of compressed air are largely determined by the energy costs of the compressor.

As a leading manufacturer of filters for compressors, MANN+HUMMEL meets this challenge with a wide range of modern filtration solutions which are matched to each other and guarantee a high degree of economy. This catalogue provides an overview of

our filters for compressors and matching accessories. MANN+HUMMEL is well-known for its OEM quality and offers filtration solutions for the whole filtration chain of compressors for the OEM market and aftermarket.

Important note for our customers

We are continually developing our product range to further improve our high performance and efficient filtration products. For this reason we expressly reserve the right to make changes to products and range of available products after the printing of this catalogue. This includes technical changes and the discontinuation of products, in particular in the case of older products. Information on changes and general availability is available from your MANN+HUMMEL contact person.

Filters for compressors

Product overview

Air/oil separators

Page 13

Application	Screw-type and sliding-vane compressors
Installation site	in pressure reservoir
Residual oil content in mg/m ³	1 to 3 mg/m ³
Operating temperature	up to 100 °C (120 °C)
Pressure drop for a given nominal flow rate	0.17 bar
Available nominal flow rates	0.8 to 76 m ³ /min
Advantages	<ul style="list-style-type: none"> • Process reliability through use of high quality media • Low oil consumption through low residual oil content • Thoroughly tried and tested and reliable • Space saving achieved through compact design

Spin-on separators

Page 19

Application	Screw-type and sliding-vane compressors
Installation site	upright on pressure reservoir
Residual oil content in mg/m ³	1 to 3 mg/m ³
Operating temperature	up to 100 °C (120 °C)
Pressure drop for a given nominal flow rate	0.25 bar
Available nominal flow rates	0.1 to 7.5 m ³ /min
Advantages	<ul style="list-style-type: none"> • Process reliability through use of high quality media • Easy, space-saving fitting and removal • Lower maintenance costs compared to conventional air/oil separators • Lower oil consumption through lower residual oil content
Accessories	Screw-on connectors and heads with connections for oil extraction

Oil filters

Page 31

Application	Oil lubricated and cooled compressors
Operating temperature	up to 120 °C
Pressure drop for a given nominal flow rate	up to 25 bar
Available nominal flow rates	20 to 200 l/min
Advantages	<ul style="list-style-type: none"> • Process reliability through use of high quality media • Easy, space-saving fitting and removal • Thoroughly tried and tested and reliable
Accessories	Heads, service switches, service indicators

Air cleaners

Page 45

Volume flow range	0,15 m ³ /min to 45 m ³ /min
Operating temperature	Continuous: -30 °C to +100 °C For short periods: +100 °C
Selection criteria	<ul style="list-style-type: none"> • High power density • Compact design • Long service life
Typical applications	Compressors
Accessories	Hoses, elbows, service indicators and switches, and rain caps

Configuration of compressor filters

MANN+HUMMEL offers a simple process for the configuration of all the filters in your compressor.

The basis is the free air delivery (FAD) of your compressor. Select the corresponding FAD in the diagram and all filters listed on the right will be suitable for your compressor. The suitable filter for a separator is determined through selection of the pressure [bar_{abs}] in the pressure reservoir. Filters determined in this way can be ordered directly from your MANN+HUMMEL partner using the specified order numbers.

This method of determining the right filter is based on certain conditions. In individual cases the conditions in the compressor may deviate from these conditions. If operation of the compressor in the field is unsatisfactory, please contact your MANN+HUMMEL partner. He will provide further assistance to improve the filter selection.

¹⁾ The figures for max. FAD and compressor performance are to be understood as guide values. The requirements of the manufacturer of the pressure stage apply or if necessary the suitable oil volume for the whole system has to be observed.

Filtration chain in the compressor

Although a compressor has a closed oil circuit, it is nevertheless generally fitted with three filters. These are required to remove dust, wear particles and oil degradation products from the oil and also to separate the oil used to cool the air in the compression process from the resulting compressed air and to return this oil to the compressor oil circuit.

The first function is managed using an air cleaner and an oil filter and the second by an oil separator (air/oil separator or spin-on separator). Although the tasks of the individual filters are clearly separated, there are, however, certain dependencies which require careful fine tuning.

In this way particles from the ambient air can enter the system via the intake, pass the air cleaner and compression stage and contaminate the oil. Therefore as well as retaining oil degradation products and wear particles, the oil filter located downstream also has to retain particles from the intake air which were not separated.

The same is true for the separator which not only separates oil from the compressed air, but is also burdened with the particles contained in the oil. These particles consist of everything which has passed the oil filter and which has been added to the compressed air in the compression chamber.

Therefore the complete filtration chain has to be taken into account, i.e. the filtration system is only as strong as its weakest component.

MANN+HUMMEL Air/oil separation for use in compressors

Air/oil separators, Spin-on separators, Accessories

MANN+HUMMEL Air/oil separation

Oil-lubricated screw compressors represent a controllable and smooth-running method for the generation of low-pulsation compressed air for use in industrial applications. The economic operation of these compressors is ensured through use of modern components. MANN+HUMMEL air/oil separators and spin-on separators are characterised by low pressure drop, high separation efficiency, compact design and sustainable operational reliability for the whole of the operating time.

Working principle

Air/oil separators and spin-on separators function according to the coalescence principle. A twin screw arrangement compresses the gas and it is transferred to a pressure reservoir. Oil is injected to seal the pair of screws to the housing and to lead the compressor heat away and is transferred with the compressed gas to the pressure reservoir. After pre-separation oil droplets remain in the compressed gas. Air/oil separators are used to join the droplets into larger droplets which are then collected and returned to the oil circuit. This minimises oil consumption in the compressor and ingress of oil into the compressed air network.

Aggregation of the oil droplets

Air/oil separators and spin-on separators consist of a winding design with a fleece medium arranged concentrically inside the winding. This is described as a post-separator. The winding and post-separator

are held by a perforated tube. As the air to be filtered passes through the wound separation medium fine droplets are retained while the compressed gas can essentially pass through without loss. In the medium the fine oil droplets combine to form larger droplets. The gas is free to escape on the outflow side of the winding while the agglomerated oil either trickles due to gravity down the pressure-resistant tube or is retained by the post-separator. The oil also drains away here under the effect of gravity and collects in a trough designed for the purpose. The positive pressure in the pressure reservoir allows the oil to return to the oil circuit via a scavenge line.

Factors which influence the coalescence

The function of the coalescence separator is influenced by various physical effects and characteristics of the gas to be compressed and the oil used (temperature, viscosity, etc.).

Oil separation according to the coalescence principle

Air/oil separation for compressors

Air/oil separators

MANN+HUMMEL Air/oil separators for compressors

The integration of air/oil separators in the pressure reservoir of the compressor enables the best possible separation performance with low pressure drop over the filter. MANN+HUMMEL air/oil separators have advanced separation technology. It increases the power density and therefore MANN+HUMMEL separators are more compact than conventional separators.

Sealing

All the air/oil separators listed in the catalogue have two flange seals as standard. This enables reliable sealing between the cover, air/oil separator and pressure reservoir.

Grounding

All the metallic parts of a MANN+HUMMEL air/oil separator have the same electric potential. The air/oil separator can be connected to the grounding of the compressor via the flange and its seals to prevent electrostatic charges.

Integration in pressure reservoir

The following points are valid for the compression of the ambient air under standard conditions. If MANN+HUMMEL air/oil separators are used under strongly deviating ambient conditions, please consult your MANN+HUMMEL partner.

- The oil content of the compressed air is lowered through preseparation. The maximum oil content after preseparation should not exceed a value of approx. 5 g/Nm³.
- Sufficient distance to oil level (approx. > 0.5 of the diameter of the separator)
- No direct flow to the separator
- The permitted volume flow rates are listed in the dimensioning table (page 6). Local peak loads (with pressure reduction) or load undercutting (pressure increase) should also not exceed the given ranges.
- The oil scavenge line must be large enough to return the separated volume of oil.

Specifications

- Continuous operating temperature¹⁾: max. 100 °C, for short periods: max. 120 °C
- MANN+HUMMEL tests using standard oils for compressors (ISO VG46)²⁾
- Pressure drop (500 hrs) : < 0.3 bar
- Residual oil content (500 hrs) : < 3 mg/Nm³
- Service life: 500 hrs bis zu bis zu 4.000 hrs (under ideal conditions, depending on the application)

¹⁾ For short periods: the dwell time at the temperature permitted for short periods must not exceed 10 minutes. The time between 2 short-term peaks must be at least 30 minutes. After approx. 300 peaks have been reached we recommend changing the seal and filter.

²⁾ The use of substantially different oils requires validation of the oil.

Air/oil separation for compressors

Spin-on separators

MANN+HUMMEL Spin-on separators for compressors

MANN+HUMMEL spin-on air/oil separators offer a solution which is easy to integrate and especially maintenance friendly for separation of the oil from compressed air within the compressor. They reliably remove oil and also return the separated oil back to the compressor which minimises the oil consumption of the compressor¹⁾. The combination with a MANN+HUMMEL filter head enables easy fitting and reliable maintenance.

Integration in the compressor

MANN+HUMMEL offers matching filter heads which enable easy integration in the system and connectors to help integration in a retainer provided by the customer. This ensures a reliable function for overhead and standing applications.

Specifications

- Max. oil content after preseparation approx. $<5 \text{ g/Nm}^3$
- Max. continuous operating temperature approx. $100 \text{ }^\circ\text{C}$, with peaks of $120 \text{ }^\circ\text{C}$
- Use of standard oils approved for compressors (ISO VG46)²⁾

Grounding

- All parts have the same electric potential (measured over the separator)
- Conductivity is tested in the production
- Electrical contact is made via the thread. The filter head is suitable for grounding.

Maintenance

- Observe the maintenance manual
- Lightly oil the seal before fitting
- Assemble with $\frac{1}{4}$ to $\frac{1}{2}$ turn after fitting the seal on the filter head (depends on thread, observe specification)

¹⁾ Depending on the respective application, the residual oil content in the compressed air may be subject to regulations. If necessary, the compressed air must be treated with suitable filters.

²⁾ If air/oil separators are used under strongly deviating ambient conditions, validation is necessary.

Spin-on separators

LB boxes

Reliability is decisively important for the sustainable function of machines and production lines and also essential for the qualitative reproducibility of high quality industrial goods. The MANN+HUMMEL LB boxes have proved themselves extensively on the market. They are a technically robust and attractively priced solution and are therefore an economic and calculable part of your process chain. They enable easy maintenance of your compressor system without long downtimes.

Specifications

- Residual oil content¹⁾: max. 3 mg/Nm³
- Initial pressure drop¹⁾: 0.25 bar
- Max. operating pressure: 20 bar (observe specification)
- Operating temperatures²⁾
Continuous³⁾: -20 °C to +100 °C
- For short periods³⁾: +120 °C
- Service life: max. 2,000 hrs / 1 bar Δp

¹⁾ At nominal load and 7 bar overpressure. Insufficient preseparation can negatively influence this value.

²⁾ Operating temperatures relate to the complete system of the spin-on air/oil separator.

³⁾ For short periods: the dwell time at the temperature permitted for short periods must not exceed 10 minutes. The time between 2 short-term peaks must be at least 30 minutes. After approx. 300 peaks have been reached we recommend changing the seal and filter.

Spin-on separators

StarBox

High quality air/oil separators are extremely important for the process reliability and energy efficiency of compressors. The StarBox from MANN+HUMMEL sets new standards in both these areas for the separation of compressed air containing oil and simultaneously offers a higher performance in the same installation space. This is made possible by a new, high performance medium specially developed for compressors. This allows StarBox to perform better than conventional air/oil boxes in the decisive areas of residual oil content and differential pressure.

The advantages at a glance:

- Up to 99 euros of energy saved per filter through lower differential pressure
- Residual oil content of 1 to 3 ppm
- Up to 25 % longer service life in comparison to conventional air/oil boxes
- Longer life of fine filters fitted downstream

The StarBox enables economic operation of the compressor at the same volume flow rate. With a higher volume flow rate and the same ancillary conditions (pressure, volume flow rate) it can also be used in the same way as a conventional LB Box.

Specifications

- Residual oil content¹⁾: max. 2 mg/Nm³
- Initial pressure drop¹⁾: 0.21 bar
- Max. operating pressure: 20 bar (observe specification)
- Operating temperatures²⁾
Continuous³⁾: -20 °C up to +100 °C
- For short periods³⁾: +120 °C
- Service life: max. 2,500 hrs / 1 bar Δp

Air/oil separation for compressors

Accessories for spin-on separators

Accessories for spin-on air/oil separators

Filter heads

MANN+HUMMEL spin-on air/oil separators function best when they are positioned above or below the filter head. In these positions the separated oil can be ideally collected in the provided reservoir or drained via the connector.

A selection of MANN+HUMMEL filter heads are available which enable a standard solution for easy integration in the compressor. These allow fitting below the filter head.

When selecting the filter head and spin-on air/oil separator care should be taken to ensure that the respectively lowest given operating pressure is not exceeded.

The oiled air is directed to the MANN+HUMMEL spin-on air/oil separator through the inlet port of the filter head and the de-oiled air leaves the filter head via the opposite side. The arrow direction must be observed. The separated oil is pressed out of the filter head via the scavenge line (not included in the scope of delivery) and leaves the filter.

Accessories for spin-on separators

Replacement seals

Standard spin-on air/oil separators are supplied with a main seal in NBR material (nitrile rubber). This proven material enables continuous operation at approx. 90 °C. If the oil temperature during operation of the compressor continuously exceeds or repeatedly for a long time exceeds this value, we recommend changing the main seal over to FKM (fluorinated rubber). Seals in FKM should not be used during operation of a compressor below the minimum temperature.

Delivery description

The packaging unit for the given reference number includes 20 replacement seals.

Replacing a seal

In order to change the seal pull out the existing seal from the holder on the underside of the spin on air/oil separator and insert the replacement seal. Take care the seal is positioned completely against the retaining slot.

Specifications

- Material: FKM
- Operating temperatures¹⁾
 Continuous²⁾: -20 °C to +100 °C,
 For short periods²⁾: +120 °C

¹⁾ Operating temperatures relate to the complete system of the spin-on air/oil separator.

²⁾ For short periods: the dwell time at the temperature permitted for short periods must not exceed 10 minutes. The time between 2 short-term peaks must be at least 30 minutes. After approx. 300 peaks have been reached we recommend changing the seal and filter.

MANN+HUMMEL Oil filters for use in compressors

Standard, Long life and High pressure oil filters,
Accessories

MANN+HUMMEL oil filters for compressors

Compressors place special demands on oil filters and coolant filters with regard to materials and design. The following listed oil filters exclusively use materials which have been tested for use in compressors.

MANN+HUMMEL offers “Standard” oil filters, “Long life” oil filters and “High pressure” oil filters.

Standard oil filters are equipped with a cellulose medium and are suitable for a change interval of 2,000 hrs.

Long life oil filters offer security with more demanding requirements. These oil filters are equipped with a fibre-glass medium which combines resistance to aggressive compressor oils with a high separation efficiency. These filters allow an operating time of up to 4,000 hrs. They are also less sensitive to pulsation influences than the standard version.

High pressure filters are recommended for applications where the operating pressure is expected to be higher than 14 bar.

Design

MANN+HUMMEL spin-on filters consist of a robust metal housing with integrated filter element. Depending on the application, the spin-on filter can be equipped with different components such as filter medium, by-pass valve, etc.. The liquid to be filtered enters the concentrically arranged inlet port on the top, flows through the filter element and in a clean state passes out through the central connection. An undetachable seal located in the cover ensures reliable sealing to the outside under all operating conditions.

The advantages at a glance:

- Available with different filter media
- Efficient separation and high dirt holding capacity with low pressure drop
- Robust, corrosion-free housing with high resistance to pulsations and high pressure stability
- Advanced flow design geometry
- Bypass valves with clearly defined opening characteristics and leakage-free closing
- Undetachable seals
- Stable, collapse-resistant centre tube

Oil filters for compressors

Accessories

Accessories for oil filters

Filter heads

A selection of MANN+HUMMEL filter heads is available which enables a standard solution for easy integration in the compressor. These allow the easy fitting and maintenance of oil filters. When selecting the filter head and oil filter, care should be taken to ensure that the respectively lowest given operating pressure is not exceeded.

The oil is directed to the MANN+HUMMEL oil filter through the inlet port of the filter head and the de oiled air leaves the filter head via the opposite side. The arrow direction must be observed.

If the specified volume flow of an individual oil filter is not sufficient, the use of a multi-head is possible to cover the requirement of the compressor.

If maintenance is necessary during operation, a switchable filter head can be used. During maintenance this enables the switching of a single filter to be free of pressure so that it can be replaced. It is necessary to observe, however, that as a result the whole oil flow will then flow through only one filter and therefore the pressure in the system will increase accordingly. This must be taken into account when designing the system.

Accessories for oil filters

Service switches

Instructions for electrical installation of the service switch

The service switch is equipped with a high quality electromagnetic switch (reed switch). In order to achieve a reliable function, please observe the following:

1. For an electrical or optical display we recommend use of a glow lamp or LED. Both can be directly switched without a spark quenching device.
2. Filament lamps require a very high starting current relative to their load current. The lamp and a series resistor should be dimensioned such that the maximum load of the switch (see rating plate) is not exceeded when switching on. We recommend selecting the series resistor such that the switch has the max. load without consideration of the glow lamp resistance. It is thereby protected against overload but the glow lamp lights up with low voltage.
3. When switching inductive loads voltage peaks can be induced which in some circumstances may cause the service switch to malfunction. For alternating current an RC combination should be connected parallel to the relay or contactor coil and with direct current a freewheeling diode (e.g. diode 1 N 4007) in reverse direction.

When dimensioning the spark quenching device the instructions of the respective contactor or relay should be observed.

In both cases the maximum load for the switch (see rating plate) must not be exceeded.

Dimension the RV so that IF is approx. 15 ... 20 mA

Accessories for oil filters

Replacement seals

Standard spin-on air/oil separators are supplied with a main seal in NBR material (nitrile rubber). This proven material enables continuous operation at approx. 100 °C. If the oil temperature during operation of the compressor continuously exceeds or repeatedly for a long time exceeds this value, we recommend changing the main seal over to FKM (fluorinated rubber). Seals in FKM should not be used during operation of compressors below the minimum temperature.

Delivery description

The packaging unit for the given reference number includes 20 replacement seals.

Replacing a seal

In order to change the seal pull out the existing seal from the holder on the underside of the oil filter and insert the replacement seal. Take care the seal is positioned completely against the retaining slot.

Specifications

- Material: FKM
- Operating temperatures¹⁾
Continuous²⁾: -20 °C to +100 °C,
For short periods²⁾: +120 °C

¹⁾ Operating temperatures relate to the complete system of the oil filter.

²⁾ For short periods: the dwell time at the temperature permitted for short periods must not exceed 10 minutes. The time between 2 short-term peaks must be at least 30 minutes. After approx. 300 peaks have been reached we recommend changing the seal and filter.

MANN+HUMMEL Air cleaners for use in compressors

Modern, high performance compressors require filters and components with a correspondingly high performance. The selection shown here provides an overview of our air cleaners and matching accessories – naturally in the well-known MANN+HUMMEL OEM quality. It is a matter of course for MANN+HUMMEL to offer individual concepts and problem solutions for special requirements.

Air cleaners for compressors

IQORON series

IQORON-S

Single-stage filter

The IQORON-S is suitable for use with all applications where very low pressure drop is a requirement. This is naturally especially true for compressors, but also includes stationary engines used for energy generation and machines which operate in low dust conditions. This is where the IQORON-S shows its strength – with a very low pressure drop.

The IQORON-S can be converted to an IQORON-V at any time if the dust conditions make this necessary: simply remove the raw air grid and replace it with the precleaner.

Cyclone precleaner

Fasteners for axial element removal without hinge

Dust discharge valve

IQORON-V 7

The IQORON-V is the ideal filter for all machines which require high reliability under heavy dust conditions. These are, for example, construction and agricultural machines and mobile compressors. Other applications also include machines and vehicles in horticulture and landscaping, as well as forklifts. The cyclone preseparator offers excellent pre-separation.

The IQORON-V achieves a pre-separation efficiency of 95 % with scavenging and 90 % without scavenging (with SAE coarse).

Two different positions for the dust discharge port enable the filter to be fitted position.

The precleaner can easily be cleaned should it become clogged during operation.

IQORON-V installation positions

The IQORON-V is available in two versions: for a horizontal or vertical fitting position. During installation make sure that the angle deviation of the dust valve to the vertical is not more than 15°. If the filter is operated with scavenging, a deviation of max. 45° to the vertical is permissible.

Air cleaners for compressors

ENTARON series

ENTARON XD

Developed for high requirements

The new ENTARON XD series from MANN+HUMMEL sets new standards for two-stage air cleaners. This series combines the best characteristics of the successful and proven EUROPICLON and NLG air cleaners with a number of innovative new ideas. This makes the ENTARON XD the new benchmark for two-stage tangential air cleaners.

The advantages at a glance:

- Excellent flexibility via variable modular design
- Economic filter system through combination of standard parts
- Corrosion-free and robust housing through use of fibre-glass reinforced plastic
- Easy handling with tool-free filter element replacement
- Total reliability through robust elements and a new sealing system
- Eco-friendly disposal through metal-free filter element (fully incinerable)
- Easy adaptation to different machines through different connection positions
- Quick first installation on vehicle through screw threads integrated in housing (option, on request)
- Suitable for use in extreme conditions

ENTARON XD

High performance filter elements

The filter elements of the new ENTARON XD are thoughtfully designed to handle demanding applications:

- A new sealing system ensures reliable sealing between the elements and housing.
- A robust middle tube made from plastic enforces the filter element and therefore protects the machine and the engine.
- The ENTARON XD uses a filter medium which simultaneously offers dramatically improved separation efficiency and a long service life.
- The MANN+HUMMEL glue string (GST) stabilizes the pleat ends and thus ensures that the element can achieve its full performance under all operating conditions. An advantage only available as standard from MANN+HUMMEL.
- The safety element in the ENTARON XD is screwed to the housing to prevent the possibility of unintentional removal and to ensure reliable function of the filter.

Robust housing

The housing of the new ENTARON XD is reinforced with FEM-designed strengthening ribs and made from plastic reinforced with fibre-glass. This means the filter is able to handle extreme physical conditions and at the same time is resistant to corrosion.

The filter construction consists of three elements with the main housing attached to the connections using a special welding process. This welding ensures a robust and reliable joint and at the same time enables unlimited possible orientations of the connection to the integrated bracket. This achieves an extremely high flexibility and enables adaptation of the filter to almost all installation situations.

The clean air outlet is also reinforced as standard with a metal ring which allows a tightening torque on the hose clamps of up to 5 Nm.

Naturally the standard version also has an integrated connection port for a service switch or indicator.

The high pre-separation efficiency of over 85 % makes the new ENTARON XD ideal for applications with heavy dust loads. This value of 85 % sets the standard for its size filter class with comparable competitor products only able to achieve a much lower value. This high pre-separation efficiency also eliminates the need for an additional external preseparator.

Clever details

Color-coded fasteners simplify handling and are easy to understand even when visibility conditions are unfavorable.

The fasteners can also be locked using special snap-in noses so they are no longer in the way when removing or attaching the cover.

Another user-friendly and clever detail!

Air cleaners for compressors EUROPICLON

EUROPICLON

The flexible allrounder

The EUROPICLON from MANN+HUMMEL is characterised by its high dust capacity and low pressure drop.

These characteristics have made the EUROPICLON the tried and tested air cleaner for all machines and equipment used in conditions with medium to heavy dust loads. These include construction and agricultural machines, mobile compressors and harvesting machines.

Advantages at a glance:

- Long service life through integrated pre-separation
- Highly economical through modular system
- Extensive range of accessories
- Corrosion free housing in impact resistant plastic
- Easy element change without tools
- Highest operational reliability through elements with proven radial seal
- Metal-free filter elements are easily disposed of by incineration and therefore are environmentally friendly with inexpensive disposal
- Easy adaptation to other equipment with a flexible bracket system
- Patented filter elements

EUROPICLON

Sectional view

Housing

The housing of the EUROPICLON is made of impact resistant polypropylene and is suitable for continuous use in the temperature range -40 °C to +80 °C or for short periods up to +100 °C.

The external polygon design of the housing is recognisable in the picture. The EUROPICLON bracket, designed especially for this structure, can be turned in increments of 5° opposite to the housing.

Depending on the air cleaner size, the housing can be turned in the axial direction to six different locking positions. This offers the designer up to 432 different fitting possibilities for the air cleaner. In addition, the wire clamps which lock the air cleaner housing can be placed in special pockets on the cap to adapt to special installation conditions.

Filter elements

The EUROPICLON elements are free of metal and therefore easily disposed of by incineration. This enables inexpensive and environmentally friendly disposal of the used elements.

EUROPICLON Main element:

- High dust capacity through special MANN+HUMMEL filter medium
- High reliability through radial seal on housing
- Reliable pleat stability prevents pleats sticking together under demanding conditions

EUROPICLON Secondary element:

- MANN+HUMMEL synthetic fabric allows a high safety margin with low pressure drop
- Secure fit in housing prevents unintentional removal of the secondary element

EUROPICLON 50

The new Europiclone 50 from MANN+HUMMEL extends the range of the successful EUROPICLON line to engines and equipment with a power rating up to 20 kW.

Along with the known advantages of the EUROPICLON line which include reliability, long service life and its robust, corrosion-free housing, the new EUROPICLON 50 has a number of additional features which offer important advantages for the designer and user.

Advantages at a glance:

- Twelve-position clean air outlet with integrated connection for service indicator or switch
- Clean air outlet available with straight pipe connection or with a 90° elbow
- Space-saving wire clamp fasteners and easy filter element change without tools
- Especially low pressure drop also in operation with fitted secondary element
- Cost-effective

Bracket

The EUROPICLON 50 bracket offers flexibility during installation with 16 different available positions around its circumference and two possible locking positions in the axial direction.

The special polygon design is matched to the air cleaner housing and ensures that the air cleaner fits securely in the bracket.

EUROPICLON 50

Filter elements

The new filter elements for the EUROPICLON 50 offer high performance and are cost-effective. The radial seal used for the main element in connection with the special pleat stabilisation enables a high separation efficiency of more than 99.95 % and a high dust capacity. A further advantage is the patented MANN+HUMMEL production technology where the seal and the element end plates are manufactured in one process step using special elastomers.

A plastic centre tube in the housing provides good support for the element without negatively influencing the withdrawal distance.

A secondary element protects the engine during a filter service or if the main element is damaged. It is an important component for comprehensive engine protection, which ensures the maximum service life

of your machine. The secondary element of the new EUROPICLON 50 consists of a special synthetic fabric, a plastic centre tube and a radial seal in PUR foam. The filter surface area is approx. 45 % larger than comparable products from the competition. This leads to minimal pressure drop with an increase in the service life of the filter.

Clean air outlet

On the clean air side the new EUROPICLON 50 is equipped with a twelve-position clean air outlet. This port is available in a straight pipe version or with a 90° elbow.

As the hanging installation position is not recommended for the service switch, MANN+HUMMEL offers the 90° elbow in two versions.

Note: The red areas are not recommended for fitting.

EUROPICLON Brackets

The brackets are especially designed for the external surface of the EUROPICLON housing and allow vibration-free mounting of the air cleaner.

From size 700 it is necessary to use two brackets.

Air cleaners for compressors

NLG series

NLG

Flexible, robust, economical

MANN+HUMMEL offers a flexible and economic solution for many varied applications in the field of intake air filtration.

Advantages at a glance:

- High flexibility through variable modular system
- Economic air cleaner system through modular design
- Easy element change without tools
- Corrosion-free and robust housing through use of plastic reinforced with fibreglass
- The Piclon version with integrated dust pre-separation can also be used with medium to heavy dust loads
- As a combination air cleaner with DualSpin pre-cleaner also suitable for very difficult dust conditions due to its long service life
- Metal-free filter elements are easily disposed of by incineration and therefore are environmentally friendly with inexpensive disposal
- Problem-free adaptation to other equipment through variable connection positions
- Quick first-fit on the vehicle through threaded inserts
- Patented filter elements

NLG Pico version Single-stage air cleaners

The Pico is the single-stage version of the NLG, i.e. without integrated dust pre-separation. It is particularly suitable for applications with low dust loads where minimal pressure drop in the air cleaner is a special requirement.

These are, for example:

- Commercial vehicles (trucks)
- Buses
- Mobile cranes
- Compressors
- Stationary engines
- Generators
- Marine applications

NLG Piclon version

Two-stage air cleaners with integrated pre-separation

The Piclon version is the two-stage version of the NLG with integrated dust pre-separation and an efficiency of more than 75 %. It is particularly suitable for applications with medium to heavy dust loads.

These are, for example:

- Construction and agricultural machines
- All typical Pico applications with a requirement for longer service life

The Pico and Piclon versions both have identical housing and connection dimensions. Therefore the Piclon can replace the Pico if the use of a machine in a certain region requires a special version. In this situation changing the air cleaner does not require making any changes to the pipe connections or to the fixing of the air cleaner bracket.

NLG

Filter elements

NLG Filter element:

- High dust capacity through MANN+HUMMEL graded medium
- Robust design with plastic centre tube
- Patented design
- Element protection due to integrated handle prevents damage during filter change

NLG Secondary element:

- MANN+HUMMEL synthetic fabric for high separation drop
- Secure fit in housing with screw fitting which further protects the engine as this prevents unintentional removal of the secondary element
- Robust design with plastic centre tube

NLG Pico version (1-stage)

Air cleaners for compressors

Picolino series

Picolino

Compact air cleaner for high requirements

The Picolino line from MANN+HUMMEL offers exceptional filtration in a compact installation space with excellent flexibility. The Picolino line is available with a number of different connections to enable it to adapt to different applications.

Applications:

The air cleaners of the Picolino line are available with a number of connection fittings and are, for example, suitable for:

- Silencer air cleaners for low-noise air intake, e.g. in small piston compressors
- Intake air cleaners for small engines (lawn mowers, power generators, etc.)
- Two-way ventilation air cleaners for gear units and tanks for liquids

Advantages at a glance:

- Excellent flexibility through variable modular system
- Economical air cleaner system through combination of standard parts
- Easy element change without tools
- Corrosion-free and robust housing through use of plastic reinforced with fibre-glass
- Cr(VI)-free
- Temperature resistant to +120 °C (for short periods)
- Material with high temperature stability available for adapters on request
- Quick response to customised filtration solutions
- Metal-free filter elements are easily disposed of by incineration and therefore are environmentally friendly with inexpensive disposal
- Patented filter elements with radial seal

Picolino

Picolino modular system

The product line consists of five master housings with various adapter pieces which can be used to adapt the cleaner to the individual requirements of customised applications. The housing, adapters and filter elements are free of metal. Depending on the design, the system covers nominal flow rates from 0.15 m³/min to 3.2 m³/min.

Filter elements

- High dust capacity through special MANN+HUMMEL filter medium
- Radial seal through elastomer end plates (protected by patents)
- Reliable pleat stabilisation prevents pleats sticking together under unfavourable conditions

Air cleaners for compressors

Picolight series

Picolight

Single stage air cleaners without housing

The metal-free air cleaners of the Picolight line from MANN+HUMMEL are characterised by an especially low-weight and compact design. We particularly recommend these air cleaners for use in stationary applications with low dust loads such as generators, compressors, marine engines, etc.

Advantages at a glance:

- Low pressure drop
- Very economical
- Compact design
- Metal-free design
- Excellent filtration performance
- Cr(VI)-free

Technical information

Use of MANN+HUMMEL standard high quality filter media achieves high separation efficiency and filtration performance in the Picolight. The Picolight is recommended for use in installation areas which are enclosed or protected against humidity. The types shown here cover volumetric flows from 1 m³/min to 100 m³/min. A tensioning strap is required to mount the air cleaner.

¹⁾ The nominal flow rate relates to flow resistance of 10 mbar.

System accessories for air cleaners

Accessories

The reliable operation of intake air cleaners for internal combustion engines and compressors must also be ensured under the most difficult operating conditions. This is only possible if the air cleaner and the accessories are perfectly matched to each other.

MANN+HUMMEL offers a comprehensive range of accessories for all air cleaners especially designed for the respective type of air cleaner. These are proven products which offer reliability and long life in numerous applications – also under the hardest operating conditions.

System accessories for air cleaners

Rain caps – Design A

In order to effectively prevent ingress of rain, snow, spray water etc. MANN+HUMMEL recommends equipping the air cleaner with a rain cap.

Since this also protects the air cleaner against coarse contaminant particles, the main element is less exposed to damage and this extends the service interval.

System accessories for air cleaners

New Electronic Service Indicator

The new electronic service indicator from MANN+HUMMEL indicates the optimal point for servicing of your air filter system and hence reduces operational cost, risk and down time.

During operation the indicator exactly displays the continuous increase in differential pressure in air cleaners in combustion engines and compressors. The electronic service indicator offers advantages for machine operators. It is easier to schedule the servicing – leading to lower running costs. The service indicator is suitable for differential pressures from 0 to 100 mbar and can be combined with the following air cleaner series: IQORON, IQORON-V, IQORON-S, ENTARON XD, EUROPICLON, NLG.

An adapter makes the indicator compatible to all air cleaners for combustion engines available on the market.

Order no.	Fig.	
39 000 70 920	1	Service indicator assy, packed (Kit including display, pressure sensor, cable harness, manual), programmable for 50/65/80 mbar
39 000 70 910	2	Pressure sensor assy, packed, with connection jack AMPSEAL 16 (Output voltage has to be evaluated with additional interface, e.g. using the on-board electronic system)
26 013 98 100	3	Cable harness assy, packed, suitable for connection jack AMPSEAL 16, with wire leads

Fig. 1 Protection class: IP50

Technical Specification

Measurement Type:	Vacuum or Pressure (Reference to atmosphere)
Operational Pressure Range:	0 - 100 mbar [0 - 10 kPa]
Media:	Air
Supply Voltage:	Normal 5 - 30 V DC; Sensor can be powered direct from vehicle up to 30 V DC.
Accuracy:	± 2,5 %
Output Voltage:	0.5 - 4.5 V DC
Over-Voltage Protection:	45 V, Forward Voltage
Reverse Polarity Protection:	36 V, Misconnect 16 V
Operating Temperature:	-40 °C to 125 °C
Storage Temperature:	-40 °C to 125 °C
Vibration Envelope:	10 - 2000 Hz at 10 g
Mounting Connection:	M10x1 female thread fits all MANN+HUMMEL air cleaners (adapter for any other air cleaners on request)

Fig. 3 Protection class: IP66

System accessories for air cleaners

Service switches for electrical monitoring of the level of accumulated dirt

The electrical service switch monitors the level of accumulated dirt in the air cleaner and sends an electrical signal when maintenance is required.

This enables constant supervision of the state of the air cleaner and maintenance only takes place when it is really necessary.

This removes potential damage to equipment which may occur through frequent and careless maintenance actions.

Technical instructions

Thanks to the completely insulated and fully enclosed contact insert, the switch is insensitive to dust or humidity. The system is not mechanical but pressure-dependent so that possible tolerances of the components do not affect the accuracy of the switch. The heart of the system is a kick-over spring that makes readjustment of the switching point unnecessary. The spring contacts are not affected by contact erosion.

As a result of the hysteresis between the points for switching and switching back, contact fluttering is reduced to a minimum. The service switch should not be fitted in a hanging position so as to prevent ingress of any condensed water into the air pipe.

Models

MANN+HUMMEL service switches are available with a number of different connection threads and plug connectors versions (Adapter from M10x1 to 1/8"-27 NPT).

Specifications

- Material: polyamide 6 GF 30
- Permissible operating temperature: -30 °C to + 120 °C
- Switching pressure (negative pressure): 35 mbar to 80 mbar (3.5 kPa to 8.0 kPa)
- Max. switching capacity: 6 W/24 V DC (ohmnic load, $U_{\max} = 24 \text{ V}$, $I_{\max} = 0.25 \text{ A}$)

Service indicators for level of dirt accumulation

The **MANN+HUMMEL** service indicator allows you to read the current level of dirt accumulation in the air cleaner, even when the engine is not in operation.

The yellow indicating piston catches on a scale of 12 snap-in positions. In the triangular display, the remaining service life of the filter is displayed, in relation to the increased clogging of the filter element.

The service indicator is insensitive to the intake air pulsations of the engine, excluding the possibility of a false indication. Maintenance is necessary when the yellow piston reaches the red zone. After maintenance has been carried out, the indicator level is readjusted to “zero” by pressing the reset button.

Specifications

- Material: PC
 - Permissible operating temperature:
-30 °C to +100 °C
 - Switching pressure (negative pressure):
35 mbar to 80 mbar
(3.5 kPa to 8 kPa)
- * readable in vertical position

Filter glossary, Conversion tables,
Request form, Further information

Glossary of terms

For air cleaners

Raw air, FAD (free air delivery)

Nominal flow V [m³/min]

Describes the nominal point of an air cleaner. For compressors the volume flow sucked in via the air cleaner is described as FAD.

Flow resistance Δp [mbar]

Measured variable acc. to ISO 5011 for the pressure drop of a filter. The catalogue always lists the negative pressure after the filter.

Dust discharge valve

Valve on the housing of two-stage air cleaners which discharges the separated dust from the air cleaner housing.

Main element

An air filter element made from a pleated filter medium through which the filtration takes place. The filter surface area defines the life of the filter.

Secondary element

An additional air filter element fitted downstream of the main element which prevents ingress of dust into the clean air pipe during maintenance work or when the main element is defective.

Service life [h]

Life of filter determined in the field before the filter needs servicing.

Laboratory service life [h]

The time measured under laboratory conditions (ISO 5011) that an air filter with air flowing through it and loaded with dust will reach a defined flow resistance. The test dust, dust concentration and volume flow must be defined.

Laboratory dust capacity [g]

The measured quantity of a defined test dust which is added to a filter under laboratory conditions until the service point is reached.

Separation efficiency η [%]

The most important task of an air cleaner is to provide adequate protection for the application in use (e.g. engine, compressor, etc.) under all conceivable operating conditions. The separation efficiency of the filter therefore has to be sufficiently high to meet this requirement. The measurement of the separation efficiency is defined by ISO 5011. A dosing device is used to add dust to the filter with a defined particle size spectrum and concentration. The filter separates by far the largest part of this dust. The separation efficiency of the filter is given by the ratio of the separated dust mass to the dosed dust mass. The separation efficiency of dry air cleaners is usually above 99.95 %.

Preseparator

MANN+HUMMEL two-stage filters have an integrated preseparator (cyclone effect through tangential inflow with EUROPICLON, NLG Piclon or ENTARON XD) or cyclone cells (IQORON-V). The separation efficiency of the whole filter is determined in exactly the same way as for a single stage filter. A higher preseparation efficiency correspondingly reduces the dust concentration which enters the main filter element and therefore a higher preseparation efficiency serves to lengthen the service life of the filter.

Glossary of terms

For air cleaners

Visual service indicator

Mounted device which visually indicates when the permitted differential pressure (clean air port to ambient environment) has been reached (indicating filter maintenance is required).

Electrical service switch

A fixture which displays the reaching of the permissible differential pressure (clean port to the environment) through closing of an electrical contact (filter maintenance). This enables signal processing.

Electrical service indicator

Indicates the continual increase in differential pressure of the air cleaner during operation. The differential pressure is displayed on the service indicator and therefore enables the planning of the filter maintenance work.

Single stage filter

Two-stage filter

Tangential inlet

The tangential inlet creates a cyclone effect and therefore preseparation.

Single and two-stage filters

Single stage filters are equipped with main separation and are the ideal solution for operating conditions with low dust levels. For conditions with medium to high dust levels, however, a two-stage filter is the best choice as this type of filter has additional preseparation. The performance of the preseparator reduces the burden on the main filter element and lengthens its life.

Dust discharge

This discharges the separated dust from the filter.

Glossary of terms

Oil filters

Nominal flow V [m^3/min]

The nominal flow is closely connected to the geometrical filter design data (nominal size of connection, filter fineness) and the physical characteristics of the liquid to be filtered (density, viscosity).

Dynamic viscosity η [$Pa \cdot s$]

The dynamic viscosity is a measure of the internal friction of the medium to be filtered.

Kinematic viscosity ν [St]

The kinematic viscosity represents the dynamic viscosity of the medium per unit density.

Bypass valve

Valve which opens at a certain opening pressure to allow an oil flow to bypass the filter medium. The valve prevents an impermissible pressure level in the system and over the filter medium (e.g. with pressure surges, when starting with cold oil or also if the filter medium is clogged).

Opening pressure [bar]

The pressure difference over the filter element where the bypass valve opens. The valve opens proportionally to the pressure difference. The usual values for compressors are between 1.5 and 3.5 bar.

Separation efficiency η [%]

The ratio of the retained dirt to the added dirt.

β_x value

The beta value for a certain particle size X is the relationship of the number of these particles before the filter to the number of particles after the filter. The conversion to the separation efficiency is as follows: $\eta = (1 - 1/\beta) \times 100$.

Flow resistance Δp [mbar]

Measured variable for the pressure drop of a filter.

Multipass test for oil filters

Test measured acc. to ISO 4548-12 or ISO 16 889. A defined dust is added until the defined differential pressure over the filter element has been reached. The result is the separation efficiency per particle size over time.

Operating pressure [bar]

The pressure the filter was designed to work with and with which it can be continuously operated.

Collapse pressure [bar]

The pressure at which the filter fails due to differential pressure over the filter which is too high.

Bursting pressure [bar]

The pressure at which the filter structure is expected to fail.

Absolute separation efficiency

In a single flow through the filter 99 % of a given particle size are separated. Example: 15 μm absolute: 99 % particles of the size 15 μm are separated in a single flow through the filter ($\Rightarrow \beta_{15}=100$).

Nominal separation efficiency

In a single flow through the filter 50 % of a given particle size are separated. Example: 50 % particles of the size 15 μm are separated in a single flow through the filter ($\Rightarrow \beta_{15}=2$).

Glossary of terms

Air/oil separators

Nominal flow / FAD V [m³/min]

FAD (free air delivery) is used as a volume flow variable in compressors. After the compression the corresponding operating parameters (pressure and temperature) must also be given.

Preseparation

Adequate preseparation is essential for the function of the separator. In many compressors this is realised via the formation of a swirl with the aid of a tangential inlet and a shield. The oil content after preseparation should not exceed 5 g/m³. The use of other types of preseparation is possible in principle provided the requirements are met.

Shield

The shield is a hollow cylinder located concentrically between the inlet port and the air/oil separator of the pressure reservoir.

Flange seals

Flange seals are a critical area with regard to electrical conductivity. These can act as insulators. Here care must be taken that an electrical contact to the pressure reservoir and from there to the electrical system exists. This can be made with the use of a metallic stack in the seals or through electrically conducting seals.

Clean air

The air flow which has already passed the separator is called clean air.

Residual oil content [mg/m³]

The clean air may have a residual oil content of approx. 3 mg/m³.

Electrical conductivity [S, 1/Ω]

On a MANN+HUMMEL air/oil separator all the metallic parts have the same electric potential. As a result electrostatic charging through air friction is prevented and discharged.

Glossary of terms

Spin-on air/oil separators (thread from above)

Flow resistance Δp [mbar]

Measured variable for the pressure drop of a filter. The MANN+HUMMEL series StarBox in particular has a significantly low pressure drop compared to a conventional spin-on air/oil separator.

Nominal flow / FAD V [m³/min]

FAD (free air delivery) is used as a volume flow variable in compressors. After the compression the corresponding operating parameters (pressure and temperature) must also be given.

Operating pressure [bar]

The pressure the filter was designed to work with and with which it can be continuously operated.

Collapse pressure [bar]

The pressure at which the filter fails due to differential pressure over the filter which is too high.

Bursting pressure [bar]

The pressure at which the filter structure is expected to fail.

Scavenge line

The scavenge line transports the separated oil back to the compressor oil circuit. It is connected to the suction side of the compressor screw. The scavenge line has to be dimensioned to be large enough as clogging or a size which is too small can impair the function of the separator.

Clean air

The air flow which has already passed the separator is called clean air.

Residual oil content [mg/m³]

The clean air may have a residual oil content of approx. 3 mg/m³. The MANN+HUMMEL series StarBox has a considerably lower value.

Glossary of terms

Spin-on air/oil separators (thread on the underside)

Operating pressure [bar]

The pressure the filter was designed to work with and with which it can be continuously operated.

Collapse pressure [bar]

The pressure at which the filter fails due to differential pressure over the filter which is too high.

Bursting pressure [bar]

The pressure at which the filter structure is expected to fail.

Nominal flow / FAD V [m³/min]

FAD (free air delivery) is used as a volume flow variable in compressors. After the compression the corresponding operating parameters (pressure and temperature) must also be given.

Connector

The connector allows the separated air and the separated oil to be separately removed without the possibility of mixing.

Clean air

The air flow which has already passed the separator is called clean air.

Residual oil content [mg/m³]

The clean air may have a residual oil content of approx. 3 mg/m³. The MANN+HUMMEL series StarBox has a considerably lower value.

Flow resistance Δp [mbar]

Measured variable for the pressure drop of a filter. The MANN+HUMMEL series StarBox in particular has a significantly low pressure drop compared to a conventional spin-on air/oil separator.

Further information:

If possible please provide us with a drawing of your pressure reservoir and a connection plan. We will naturally handle these documents in the sense of the standard ISO 16016.

Please fill in this form as best as possible and send it to your MANN+HUMMEL partner.

MANN+HUMMEL Group

The MANN+HUMMEL Group is a company with international operations and employs 16,000 people worldwide at more than 60 international locations. The company develops, produces and sells technically complex components and systems for the automotive industry and the field of mechanical engineering. A key area is high quality filtration products for vehicles, engines and

industrial applications. The OEM business with leading global manufacturers in the fields of vehicles, machines and plant form the basis for the quality and high performance of the products. Filters for the international aftermarket are sold under numerous well-known customer brands as well as under the company's own MANN-FILTER brand.
