#SITC2017

Rationale for Biomarkers and Complementary and/or Companion Diagnostics in Immunotherapy

 (+) for predictive response biomarkers

 (-) for predictive response biomarkers

All-comers

- No use of biomarkers for patient enrichment
- Minority of patients respond

Enrichment

- Use of biomarkers that may predict response
- Ensures sufficient number of biomarker (+) patients

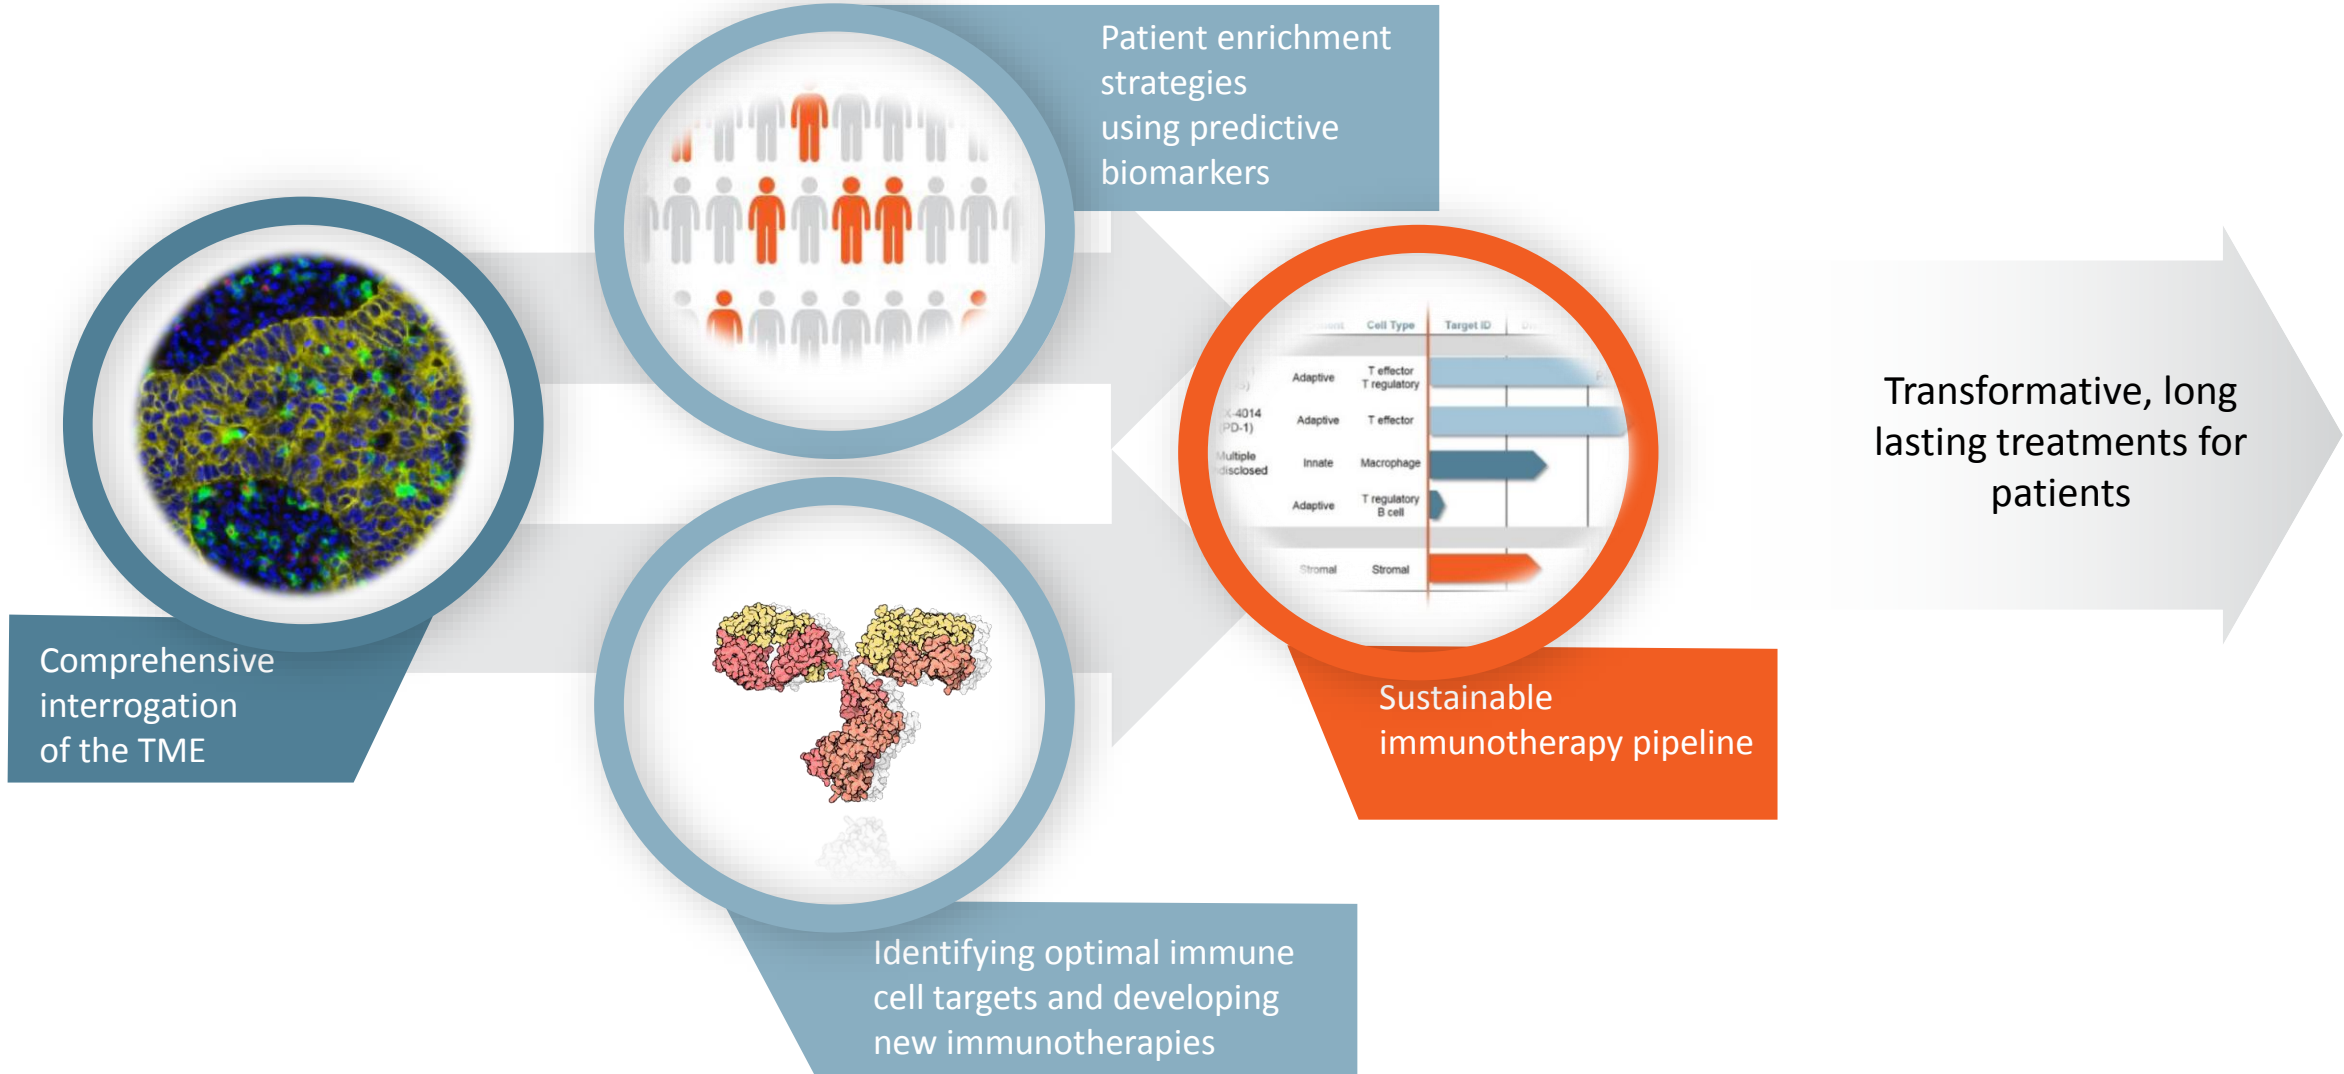

Selection

- Biomarker expression required for enrollment
- Maximizes for potential responders

For illustrative purposes only, actual numbers may vary
Biomarker positive does not guarantee response to drug

Translational Science Platform

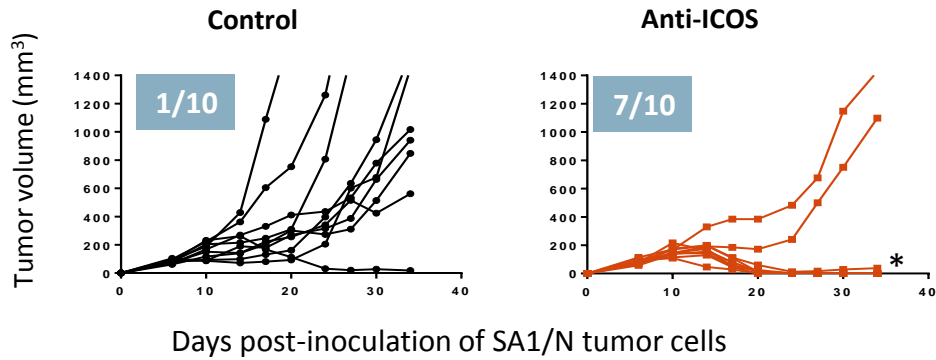

JTX-2011 Shifts Balance of T Cells Towards Anti-Tumor Activity

Critical Requirements for Preclinical Response to JTX-2011

1 Sustained target engagement in vivo: all available ICOS must be bound by JTX-2011

* Upon rechallenge "cured" mice reject tumors

Efficacy in mouse tumor models observed only at doses resulting in sustained target engagement

PK/PD model predicted human dose resulting in sustained target engagement

2 Efficacy in mouse tumor models requires ICOS(+) infiltrating immune cells within the tumor

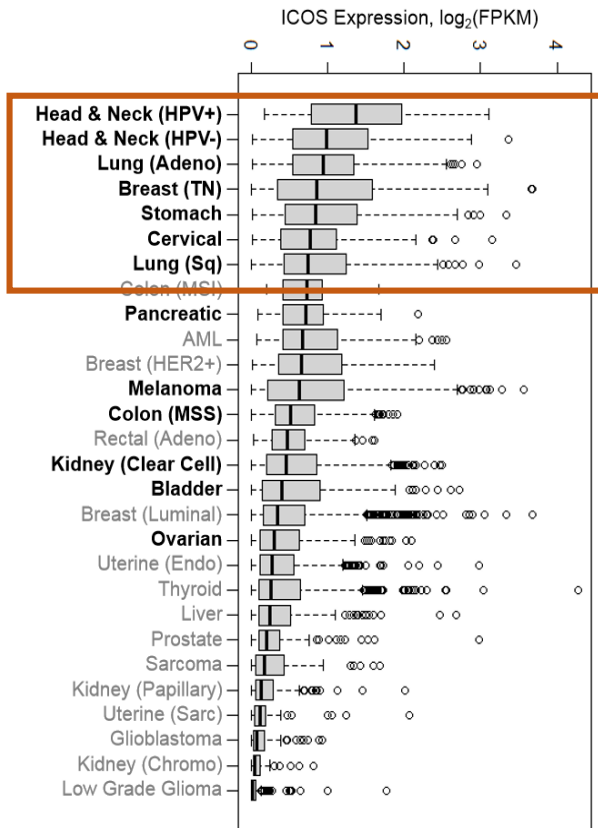

ICOS biomarker scoring system developed to determine threshold to predict response

Biomarker translated to human tumors for patient enrichment in the clinic

Phase 2 Indication Selection & Patient Enrichment via Biomarkers

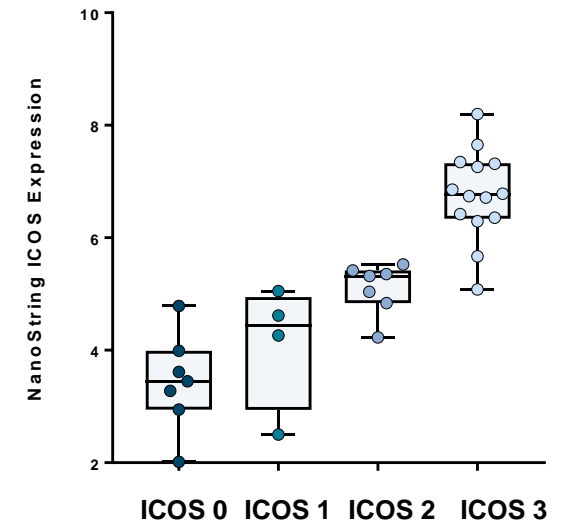

Rank order of tumor indications based on ICOS RNA expression in TCGA

ICOS protein levels vary across indications and within individual indications

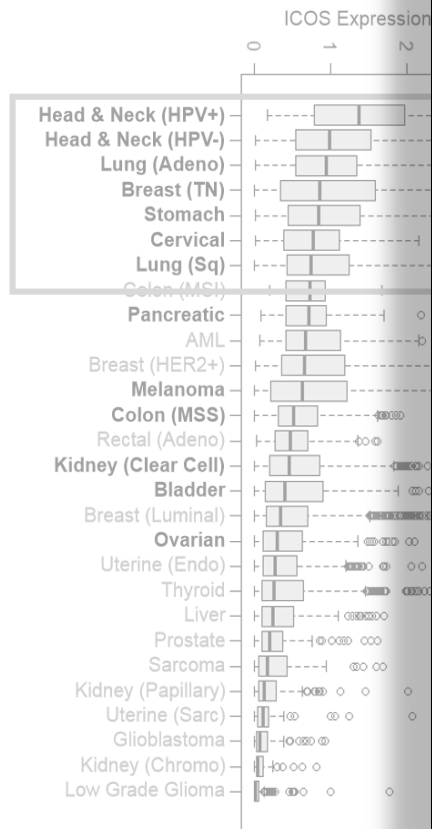

ICOS RNA levels correlate well with ICOS protein levels via IHC

IHC and NanoString analysis of HNSCC histoculture samples

Phase 2 Indication Selection & Patient Enrichment via Biomarkers

Rank order of tumor indications on ICOS RNA expression

1 Select indication priorities

HNSCC, NSCLC, TNBC, melanoma, gastric, plus undisclosed “niche” indications

Includes IO naïve and IO failures

2 Prospective enrichment of biomarker high patients into study cohorts

10 patients in each cohort ICOS 2/3

ICOS 2/3 required for preclinical efficacy

correlate well with ICOS levels via IHC

anoString analysis of histoculture samples

Integrated Approach to Understanding ICOS in the Context of Immune Oncology Landscape

Collaborations with premier institutions

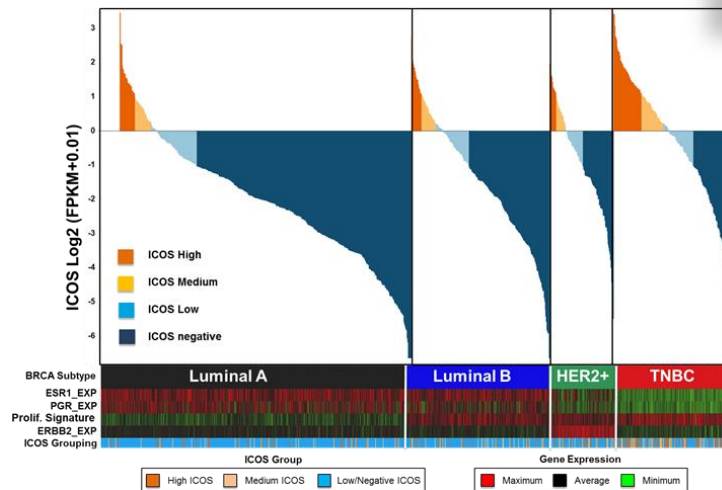

1000s of human tumors interrogated

Adaptive immune cells
Innate immune cells
Stromal cells

Integrated TCGA and internal data analysis

Enriching patients for our clinical trials

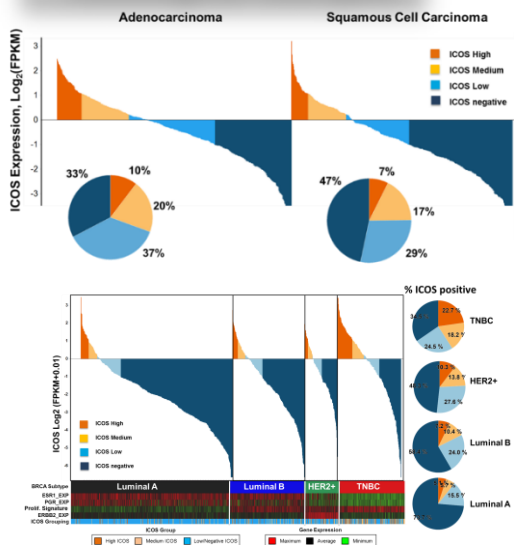

Integrated Approach to Understanding ICOS in the Context of Immune Oncology Landscape

Characterization within microenvironment

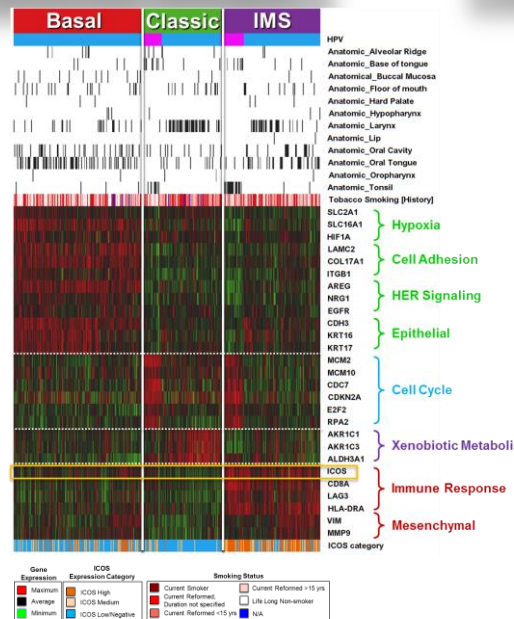

Histological Subtypes

Viral Status

Molecular Subtypes

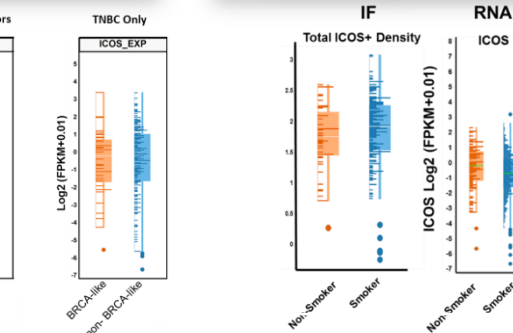

Oncogenes/Tumor Suppressors

Known Mutations

Smoking Status

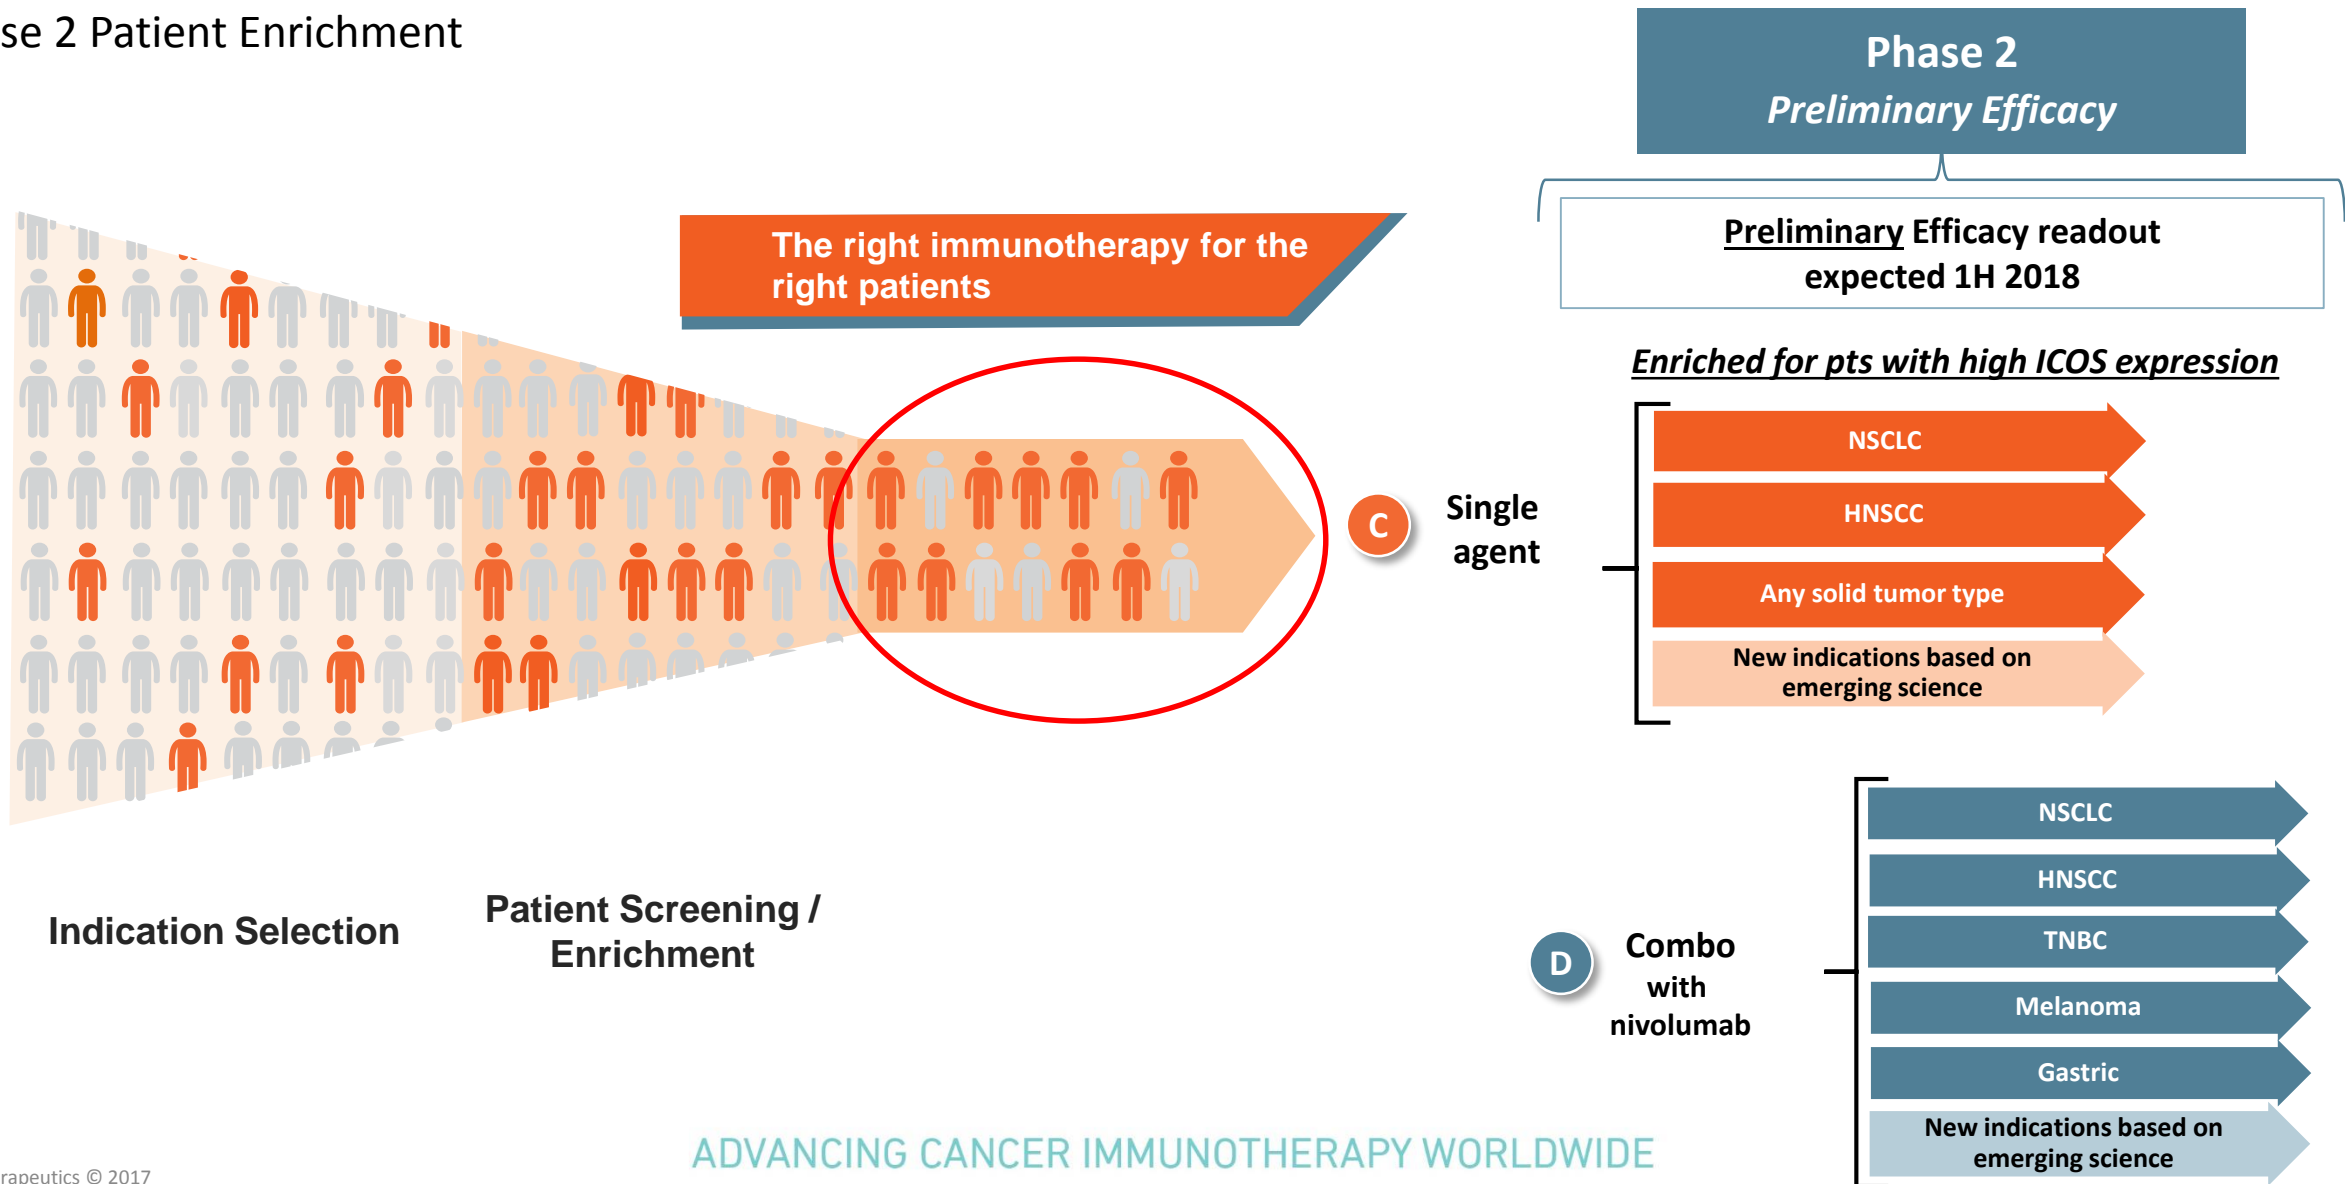

Context with Checkpoint inhibitors

ICONIC: Adaptive, Biomarker-Driven Clinical Study

Phase 2 Patient Enrichment

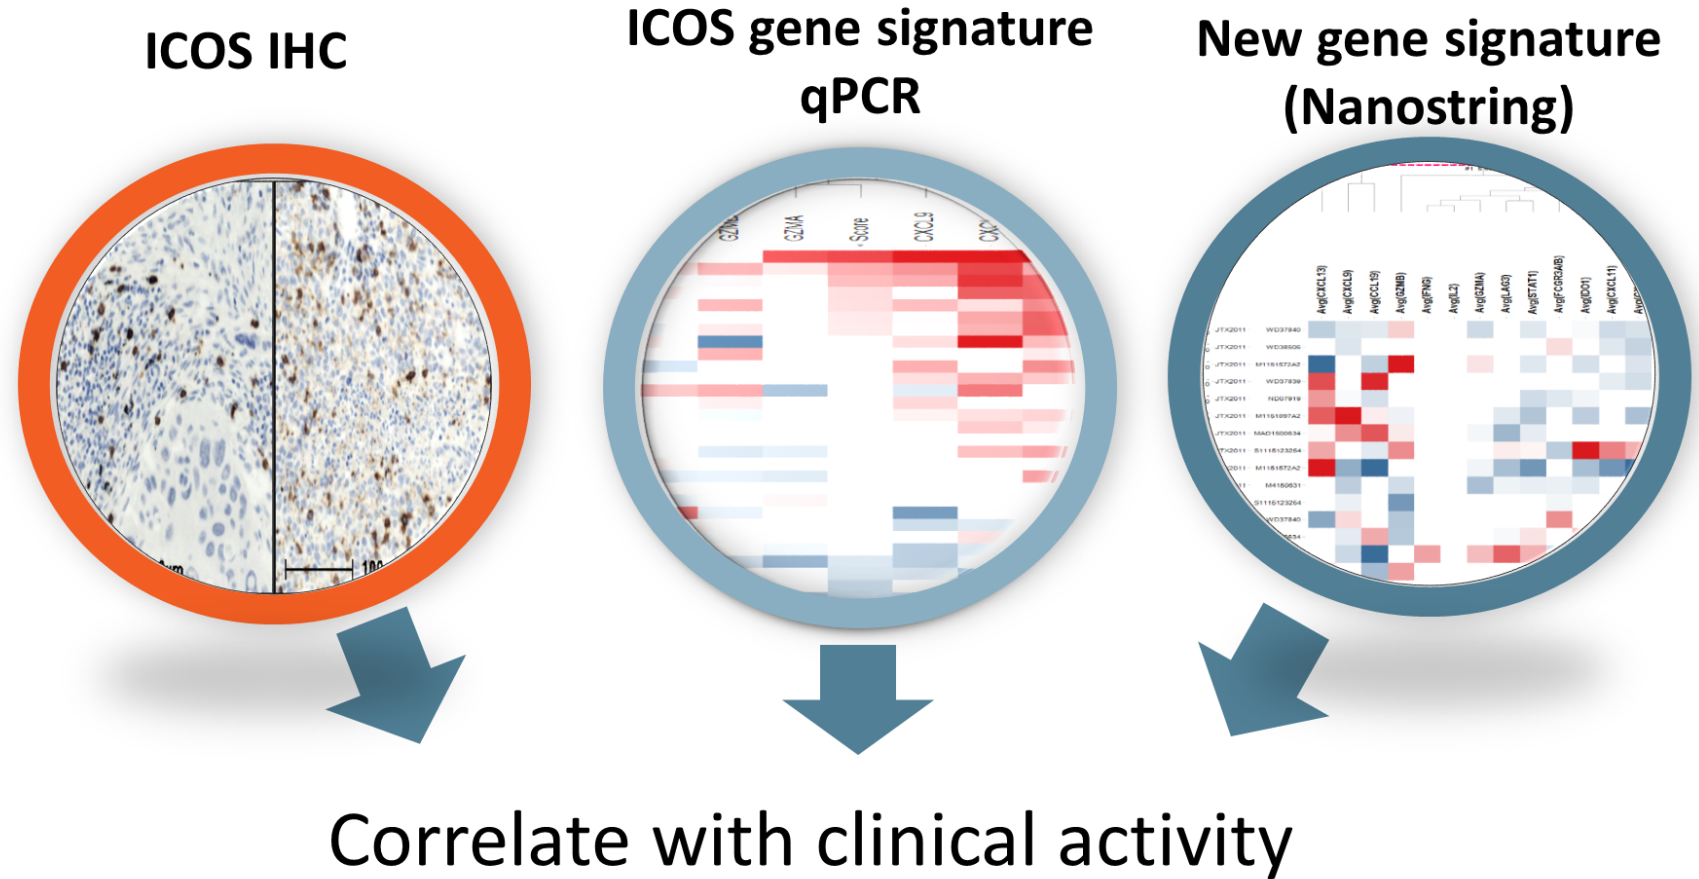

ADVANCING CANCER IMMUNOTHERAPY WORLDWIDE

Developing predictive biomarker assays for the ICONIC trial

Potential predictive biomarkers to be correlated with efficacy:

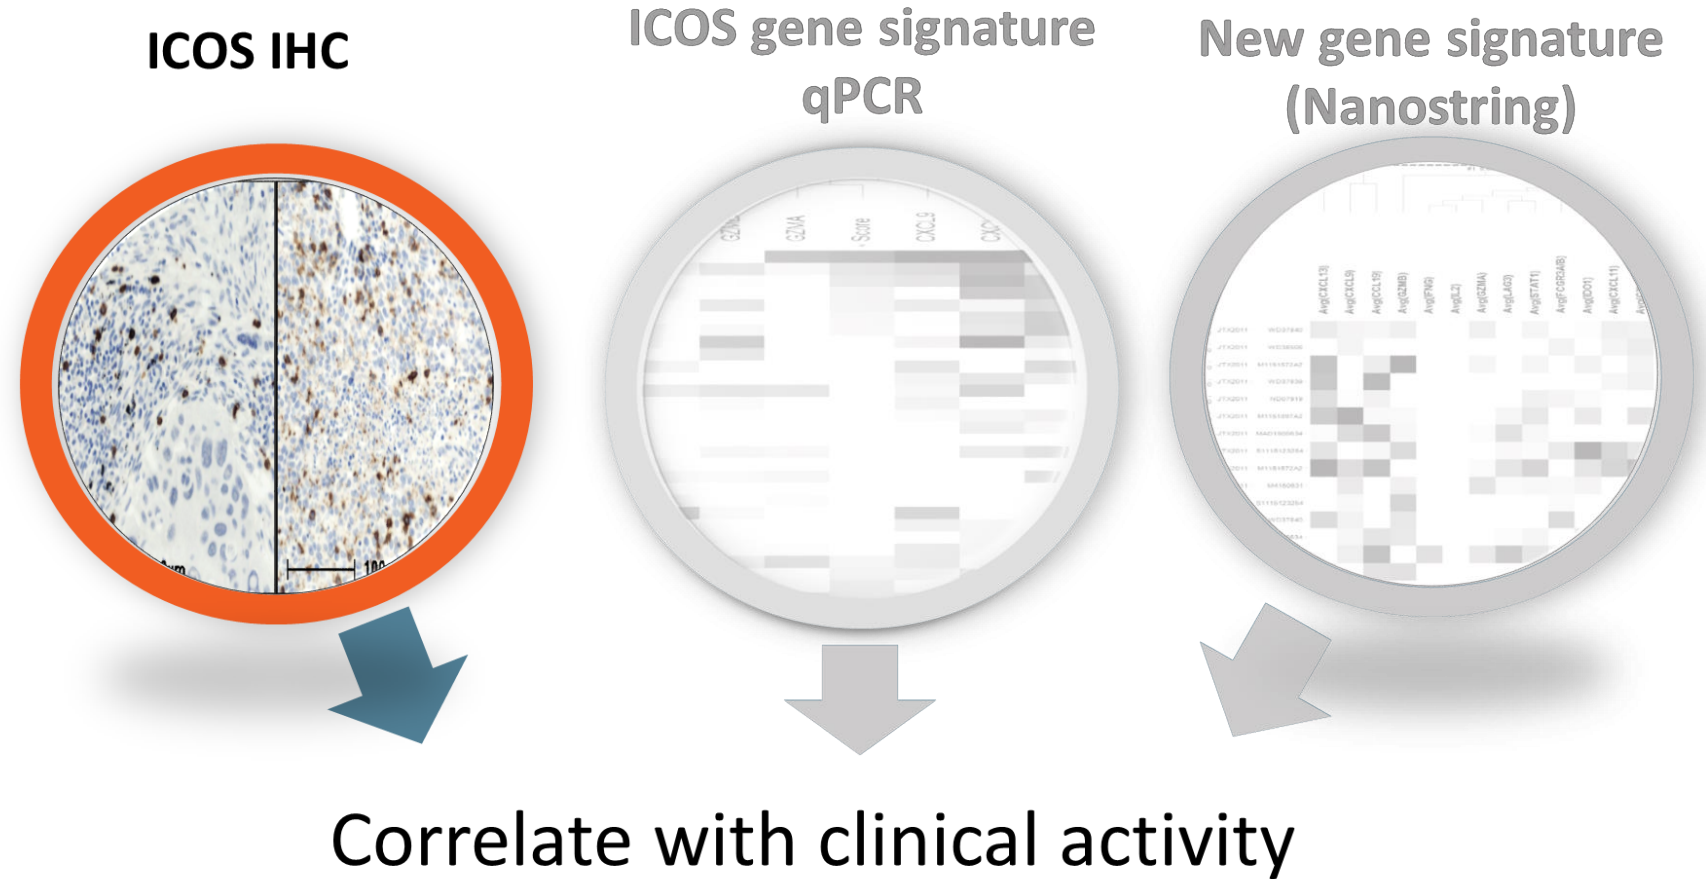

1. ICOS by IHC
2. ICOS gene signature by qPCR
3. Exploration of alternative gene signatures (NanoString analysis)

Developing predictive biomarker assays for the ICONIC trial

Potential predictive biomarkers to be correlated with efficacy:

1. ICOS by IHC
2. ICOS gene signature by qPCR
3. Exploration of alternative gene signatures (NanoString analysis)

Development of an ICOS IHC assay for ICONIC enrollment

ICOS Scoring Criteria	
< 1%	0
≥ 1% but < 5%	1
≥ 5% but < 15%	2
≥ 15%	3

*in carcinoma region only

- Chromogenic IHC assay developed in house with proprietary anti-ICOS antibody
- Developed for the Leica Bond III platform
- Assay transferred to and validated at CLIA lab
- Currently in use for ICONIC clinical trial patient stratification

Percent positive ICOS correlates to ICOS RNA expression in HNSCC and NSCLC

Total ICOS IHC score correlates to ICOS RNA expression in HNSCC and NSCLC

Frequency of ICOS positivity in tissue microarrays and ICONIC patient samples

Immunofluorescence

Chromogenic IHC assay

Patient samples screened by IHC

Developing predictive biomarker assays for the ICONIC trial

Potential predictive biomarkers to be correlated with efficacy:

1. ICOS by IHC
2. ICOS gene signature by qPCR
3. Exploration of alternative gene signatures (NanoString analysis)

ICOS IHC

ICOS gene signature qPCR

New gene signature (Nanostring)

Correlate with clinical activity

Developing an ICOS RNA gene signature

Criteria for gene selection:

- Frequently found
 - Must be in the top 300 genes in at least 10 indications
- Highly ranked on average
 - Within the top 75 genes identified on average across indications

The 11 gene ICOS signature is coherent across all solid tumors in TCGA

ICOS signature is highly correlated to ICOS gene expression across tumors types

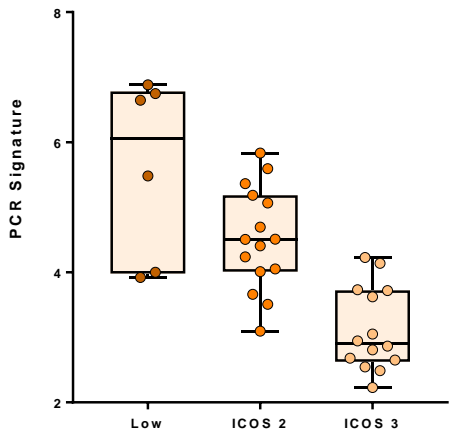

Developing an ICOS RNA gene Signature

The 11 gene ICOS signature is coherent in the PCR assay

ICOS RNA signature by both PCR and NanoString correlates with ICOS IHC

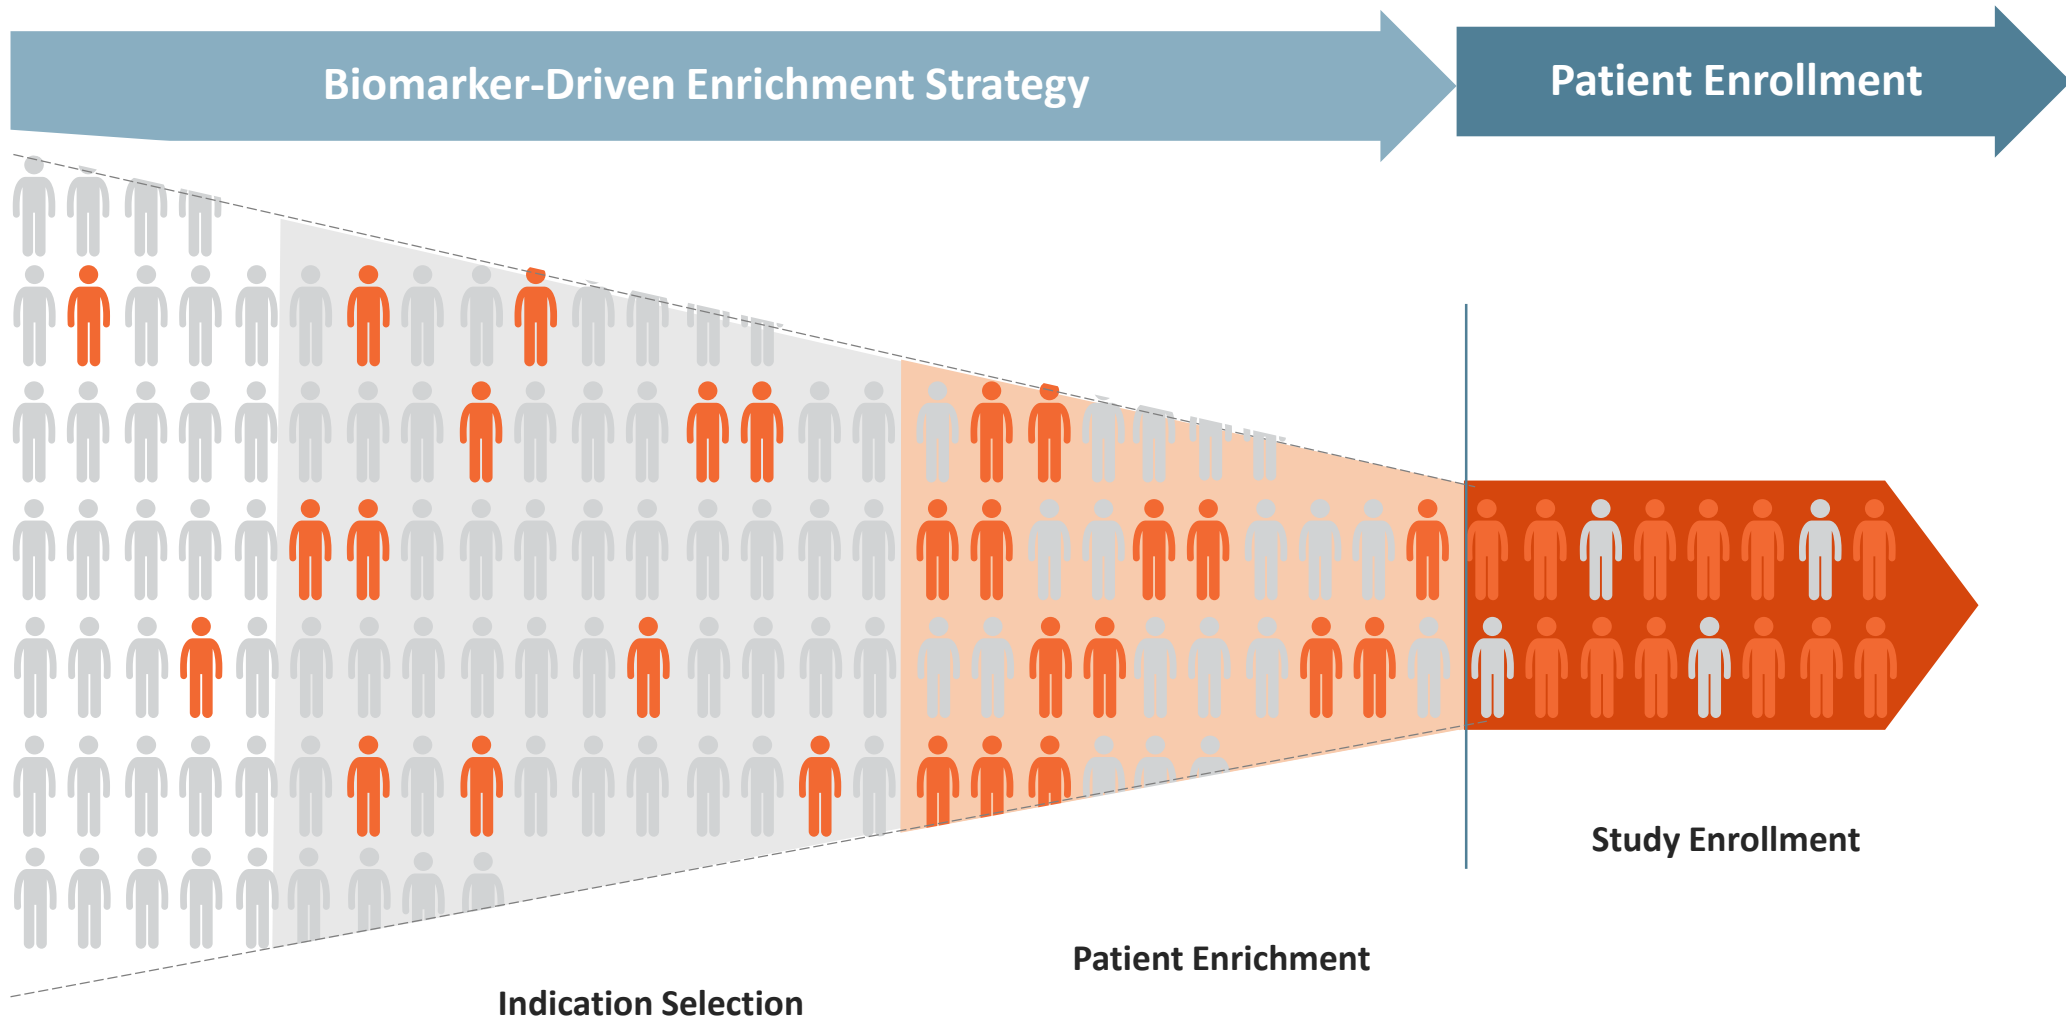

ICOS expression and ICOS signature are highly correlated between PCR and NanoString platforms

- Transferred 11 gene signature to CLIA lab
- Developed with 4 house keeping controls in FFPE tumor material in multiple indications
- Is currently in use for retrospective testing in the ICONIC trial

Biomarker-Driven Strategy for Patient Enrichment

Potential for Establishing Complementary and/or Companion Diagnostics

ADVANCING CANCER IMMUNOTHERAPY WORLDWIDE

Thank You

As always, Jounce is exceptionally thankful to all of the patients and families participating in the ICONIC clinical trial.
