

# Lone Worker Protection

## Smart protection on the UK's leading smartphones

### Orbis' solution to protect your LoneWorkers utilising a range of leading smartphones

The powerful code5<sup>®</sup> service application delivers a truly comprehensive range of staff protection features all backed 24/7 by Orbis dedicated operators.

Like your smartphone, the code5<sup>®</sup> service is always ready and highly dependable. Operating to the highest industry standards and accreditations, the combined solution ensures your vulnerable employees benefit from the best technology and protection available.

#### KEY FEATURES

- Simple dedicated panic button
- Keypad lock override (device dependant)
- Two-way voice in Red Alert situations
- GPS, LBS and WIFI positioning
- Over-air service configuration backed up by our technical support helpdesk
- Web based mapping portal for realtime and historical locations
- Fall detection alerts
- FGPRS communication with SMS backup
- Status and notification alerts
- NFC capability (Proof of Presence, Access Control, Check Point, etc)

#### BENEFITS

- Real-time locations - Get visibility of current locations to enhance safety, efficient working and productivity
- Welfare Check - Timed welfare checks do not need the user to physically raise an alert
- Easy user interface and icons for rapid learning and simplicity of use
- Single device solution - familiar technology, fast set up, minimises capital outlay
- Flexible, bespoke contract terms, group bundled pricing
- Transparency - full audit and visibility of staff activity, 24/7 real-time information. Web based user admin tools

# Smarter working needs smarter protection

## HOW IT WORKS

### Location for GSM Smartphone

The Amber Alert functionality connects users to response centre software where they can record their whereabouts. In an emergency, the information is retrieved automatically and verified using network cell location. (LBS).

### Location for GPS Smartphone

Satellite positioning technology linked to detailed digital mapping, confirmed by network cell location (LBS), clearly shows operators where the user is in real time to within 5 metres due to the sensitivity of GPS chipset receivers in smartphones.

### Location for WIFI Smartphone

Internal positioning using WIFI technology for when GPS is not achievable, linked to detailed digital mapping meaning users should always be located in an emergency situation.

### Simple Device activation process

The code5® application can be activated individually with each user downloading the app directly to their smartphone. Users then follow a few steps to complete the activation before they are then live and connected to the code5® platform.

### User profile and escalation measures

Prior to service activation, all critical user details and other relevant information is recorded to assist operators during an emergency. Each user has either an individual or generic pre-defined escalation procedure to ensure the correct actions are immediately taken.

### Health and Safety

The code5® solution helps meet Health and Safety at work requirements to ensure employees remain safe from 'reasonably foreseeable danger' and are protected from exposure to 'reasonably foreseeable violence'. The service also helps employers to fulfil a duty of care under the Corporate Manslaughter and Corporate Homicide Act 2007.

## ADDITIONAL FEATURES

- Fast dedicated access to emergency services
- Internet reports and audit trails
- All calls digitally recorded and available for evidential purposes
- Bespoke emergency protocols by individual or group
- Service not device dependant - quick switch over to replacement devices
- Red and Amber Alert - pre-record your position and activity, combine this with a timed safety check, or, in an emergency, a specific button press to bypass the keypad locks and raise a Red Alert for immediate assistance (device dependant)

“Code5® one of the most popular lone worker protection services in the UK”
