

## LINTEN NETWORK PROTECTION

Give employees and guests safe, responsive internet access by preventing malware and botnet attacks, while restricting undesirable content.

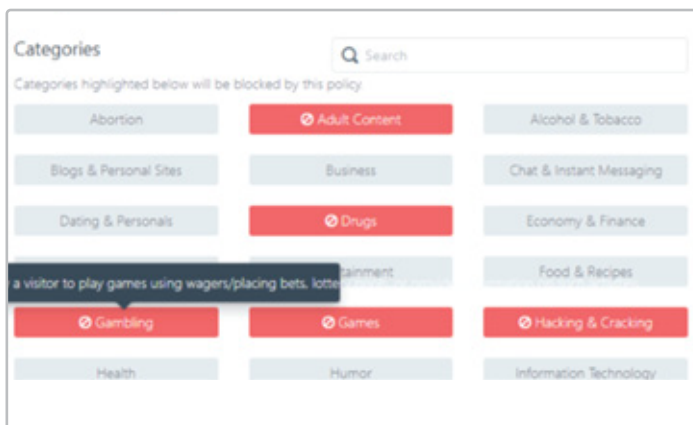

Linten Network Protection brings web filtering into the cloud, eliminating the need for hardware. It provides all the benefits of an appliance and unlimited scalability, at a much lower cost to your business.

As more and more offices connect directly to the internet, leaving corporate intranets and backhaul circuits behind, Linten Network Protection is an ideal way to manage and monitor both the threats targeting your users and the type of traffic coming from each office location.

## Manage Bandwidth

Linten Network Protection allows you to control which categories or domains your users can access. This level of control makes it easy to block bandwidth-intensive sites such as streaming media, peer to peer, file sharing or even written content. Therefore, in addition to protecting network devices and users, Linten Network Protection frees up valuable bandwidth to keep your business operating at lightning speed.

## Restrict Access

Every business relies on the internet, but this essential tool can also reduce productivity. Not all employees waste time, but Linten Network Protection can remove the temptation by allowing you to block access to certain domains or high-bandwidth activities, such as social media, gaming or music streaming sites.

## One Click Security

Traditionally, preventing malware and botnet attacks was costly and labour intensive - requiring expensive hardware appliances deployed on site. By using Linten Network Protection as your recursive DNS provider, you can make onsite appliances a thing of the past. Now, you can seamlessly add malware/threat detection and prevention capabilities in a matter of minutes.

Block/Allow	Description
Botnet	Command and Control botnet hosts. Prevents receiving commands from botnet hosts.
Malware	Malicious software including drop servers and compromised web servers.
Phishing	Fraudulent websites that aim to trick users into handing over personal information.
Proxy & Filter Avoidance	Sites that provide information or a means to circumvent DNS based filtering.
Translation Sites	Sites that perform translation from one language to another, usually for search engines.

Linten Network Protection uses global cloud threat intelligence to provide real-time data on and prevention of threats facing your network - even allowing you to deny further CnC (command and control) call backs when an infected device is introduced into your network.
