

ROTEC

SHUTTLE HOPPER

The Shuttle Hopper is Rotec's signature drop point and metering system machine. When used in conjunction with other Rotec products the Shuttle Hopper is a centralized dumping point for concrete haulers. It is also a metering device, ensuring that the flow of material into a conveyor system is correct, as specified by the contractor and within system capabilities. The Shuttle Hopper utilizes a hydraulic plunger system to ensure a steady flow of material and can be manufactured in various bin capacities. Covers are also optional to protect both operator and materials from falling debris and the elements.
