YOUR COMFORT SPECIALISTS

FAMILY OWNED AND OPERATED SINCE 1974

How Flood Waters Can Affect Your Heating & Cooling Systems.

Hurricane Matthew recently dumped an unwelcome amount of rain on eastern North Carolina.

The result has been widespread flooding along with the heartache experienced by home owners across the hurricane's path. While some were blessed with little or no damage, others are facing huge reconstruction projects or even permanent relocation.

Even worse, there were casualties. And yet no matter how devastating Matthew's impact may have been, it was not enough to dampen the spirit of friends, neighbors, and complete strangers who came together to help those in need of food, shelter, repairs, and more.

First responders, power companies, the North Carolina Department of Transportation, and volunteers from all over were in place as quickly as possible to help restore our state. North Carolina residents turned this widespread devastation into a time of caring for others and healing that we will never forget.

Homes with high flood waters were hit particularly hard, and that includes damage

Several members of our heating and cooling installation department

to their heating and air conditioning systems along with their air duct systems.

While your AC system was created to withstand the elements, you should have it inspected if it was immersed in standing water. The same goes for your heating system. Water usually has to reach about a foot in depth to affect either system, but even if it was less, **the cautious move is to have Jackson & Sons inspect your heating and cooling systems** to ensure safe and effective operation.

Should we uncover any repairable problems, we'll present you with a guaranteed upfront price quote to fix them, and explain exactly what needs to be done and why. At the same time, you can **save money now with the three special offers below.**

Please let us know what we can do to enhance or restore your family's greater comfort, convenience, and safety... *Around the House.*

Heating & AC Replacement

0% FOR 48 MONTHS

How to Prevent Carbon Monoxide Poisoning.

Carbon monoxide (CO) is a byproduct of burning various fuels and can come from a variety of common, everyday home appliances, like gas fireplaces. It's a tasteless, odorless, colorless, and poisonous gas when inhaled, and all steps should be taken to help ensure you never do.

If you have carbon monoxide detectors in your home purchased from a home center, typically they do not alert you until CO gases have reached 70 parts per million (ppm) or higher. At that level, carbon monoxide could already have been present for up to 3 ½ hours... time enough to cause physical harm.

Here at Jackson & Sons, however, we install professional grade NSI CO detectors. Here's why:

- **The alarm sounds at CO levels as low as 5 ppm**, giving you plenty of time to evacuate your home before anyone becomes ill.

- **Our NSI CO detectors employ the same technology and sensors as those used by fire departments and utilities.**

- **What's more, they're battery operated and offer you true 24/7 protection.** Plug-in models don't always permit ideal placement and don't work during power outages.

To learn more or to schedule installation of NSI CO detectors in your home, contact Jackson & Sons today, and **save \$10 off** on each one you purchase.

CO Detector

SAVE **\$10**

... on each NSI CO Detector purchased from and installed by Jackson & Sons. This offer is valid through **December 31, 2016** and may not be combined with other discounts. Does not apply to previous installations.
