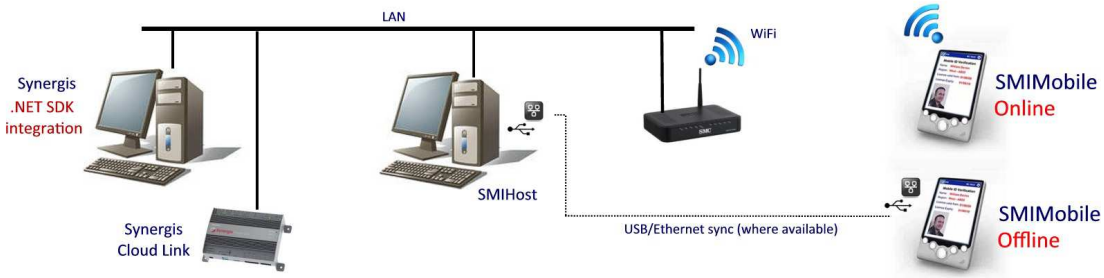
Mobile Access Control for…

Genetec Synergis

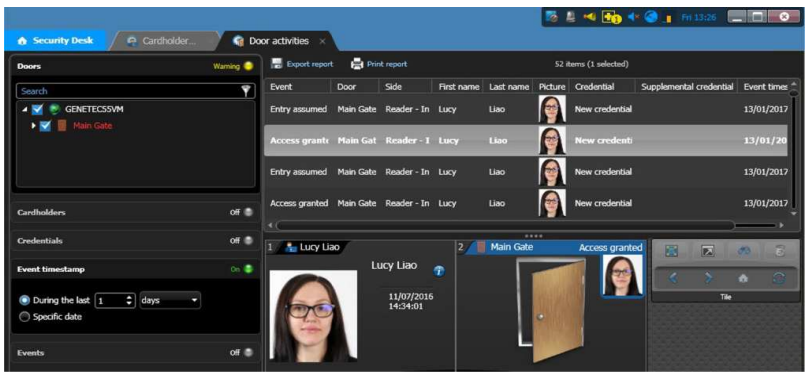
Adds a mobile dimension to Synergis, enabling a portable device to be an integrated component of the Access Control system and adding significant value to the security proposition.

Can be used for checking workers onto site, checking card validity, checking cardholder details, mustering, attendance at classes or events, training, conformance and skills checking.... anything a fixed reader would be deployed for and more besides.



Comprehensive integration

- *Data is synchronized using the Genetec SDK, either in bulk when initializing or via change events to maintain.*
- *Virtual readers assigned to doors in Synergis. Card scan events available through Reporting and Activity screen*
- *Access decisions received from Synergis when a card is scanned on a mobile device.*



- *Supports Online and Offline Access Decisions, Occupancy, Mustering*
- *Readers can operate online via WiFi or Cellular communications, and can operate offline with data synchronized via WiFi, Cellular or (where available) USB/Ethernet connections.*
- *Choose Synergis data required and display layout with customizable templates.*

Works for your environment

A range of mobile devices is available to accommodate most card technologies, operating environments and functional requirements, including recently released compatibility with NFC phones.
