

REPLAY AQUACOURT

Specialist Hardcourt Cleaning

AquaCourt will deep clean (200 bar) the surface firstly using a bespoke high-volume, multi-nozzle pressure washer system, cleaning in one direction and then the opposite direction to lift and soften the silt, algae and moss from the grain of the surface.

The surface is then cleaned over the whole area using a combination of oscillating turbo lances and flat fan high pressure spray system to turbo wash and ensure all contamination is effectively removed..

The AquaCourt system has been designed so that it can fit through tight access points (1m gates etc.) The machine mounted process contains everything that is required to thoroughly and effectively clean the surface including an integral large water storage tank.

Please note that the AquaCourt system requires a good on-site water supply giving 12/14 litres of flow per minute (this is an average domestic supply rate).
