Rugged computers

Maintain good communication in difficult conditions

Military operations often take place in difficult conditions: in the desert heat or arctic cold; in tropical rain or humid jungles; and in arid sandy plains. Not only must computer equipment withstand such tough conditions, but also the shocks and vibration common in military situations.

MilDef is well aware of what defence forces have to face in various theatres of operation, and is dedicated to developing and supplying a variety of rugged computers that help military personnel maintain good communication wherever they are.

An extensive range

We offer an extensive range of rugged computers and associated equipment as presented in this brochure. Most of the units are ideal for use by army, navy and air force personnel, although ground forces represent the biggest application area. MilDef units are found in ground vehicles such as tanks, armed personnel carriers and smaller road vehicles. They are also used in staff headquarters, field tents, and by all ground forces.

As we can satisfy virtually all of your computer equipment requirements, MilDef is the only contact that you need.

Mobile solutions

MilDef products ensure maintaining high situational awareness and the tactical advantage in a combat zone. For example, our MilDef DE13 is a combat-rugged slim tablet built to be used in harsh conditions as a soldier device or in military vehicles and naval vessels, running military applications such as BFT, BMS client and FAC.

The MilDef DE13 is equipped with all the technology you need in such situations and can be customized to meet customer requirements. It has high brightness LCD multi-touch screen, and complies with several common standards, including MIL-STD-810G, MIL-STD-461G and IP67.

Customized units

As MilDef is a flexible and very service-minded company, we respond quickly to customer demands. We can rapidly customize units to exacting standards

and deliver them within tight time frames, whether it only concerns a few tailored products or hundreds of units. Computers can be modified and equipment connectors changed to suit your complete system. In addition, our accessories enhance the performance of our computer equipment. Naturally, they are designed for tight integration with our products.

As you would expect, our development department uses the latest technology in the design, development and manufacture of our product range and in customizing computers for our customers.

We have our own EMI chamber where we can test products and verify their performance after modification or upgrades.

Compliance and Military Standards

As we are familiar with the extreme conditions under which military computer equipment operates, we use only the high-quality designs and materials necessary to protect and maintain long-term functionality and reliability. We are certified according to ISO 9001:2015 regarding design, development and production. We are also ISO 14001:2015 certified, and our care for the natural environment forms an important part of our business strategy.

All our units are built to comply with tough military standards to further ensure their high performance over long equipment lifecycles. They are, at a minimum, true IP54 products as well as fulfilling MIL-STD-810 and MIL-STD-461.

Sustainable products

A key consideration taken into account when designing new equipment is to make it sustainable and highly reliable. This satisfies the demand of defence equipment purchasers for the long-term stable supply of particular types of equipment. Such sustainability also matches the long lifecycles of most military vehicles and aircraft, and the need to continually update systems. Typical MilDef features that promote sustainability and cost-effectiveness are a form factor that remains the same even if computers are updated, a computer lifecycle of up to ten years, and lifetime support for all MilDef units.

19"/2[®] Product range

Save up to 75% of space or add more functionality

Our innovative approach to product design can be seen with our new modular 19"/2[®] units. Being only 50% of the size of the existing 19" form factor, they create up to 75% more space in racks. This makes it possible to mount more units and hence add functionality. Smaller units are particularly valuable for use in cramped spaces, such as found in ground vehicles and aircraft.

This is a perfect example of where we are truly reshaping your communication power.

Endless configuration possibilities

The ability to readily combine communication units of the 19" form factor with units of MilDef's 19"/2[®] form factor gives the practical benefits of integrated solutions and endless configuration possibilities to quickly build the communication system you want.

More important benefits

The smaller size of our 19"/2[®] modules provides you with the additional important benefits of:

- Less weight
- Less energy consumption
- Less heat generation

Sustainable form factor

A key consideration taken into account when designing our 19"/2[®] form factor was to make it sustainable. This satisfies the demand of defence

equipment purchasers for the long-term stable supply of particular types of equipment. Such sustainability also matches the long lifecycles of most military vehicles and aircraft, and the need to continually update systems.

Moreover, we assure you of lifetime support for all MilDef equipment.

Typical application segments

The various communication units of the MilDef 19"/2[®] product series are typically used within the following military segments:

- Ground vehicles
- Deployed forces
- Special forces
- Air force
- Navy

Customized units or special electronics

Our 19"/2[®] communication units are supplied as military off-the-shelf (MOTS) products, but MilDef can complement these with our hardware according to customer specifications. In addition, if there are no MOTS products that suit your needs, we can design special electronic units based on your particular specifications.

19" rack installation

Two or more modules can be stacked on top of each other

Two modules can be mounted together in a 19" rack

Stand-alone installation

The possibilities are endless

Rugged Displays

Forged in the thick of battle

Every MilDef RD display was inspired by action in the field. Each design was developed in cooperation with armed forces to meet the ongoing communication challenges of their armored vehicles and command posts. The range we have today is the result of 10 years of such in-depth collaboration.

We push display technology forward by finding the critical areas of improvement as revealed by on the ground use. That's why MilDef displays are not only some of the toughest on the market, but adapted to the finer points of military operations like the need for stealth, to save space in tight quarters and to be easily integrated with other equipment.

Today, the RD range is a staple of military operations with thousands in use by armed forces around the world.

Performance where it matters most

You can count on our RD displays even in the harshest conditions. They are combat proven to withstand severe shocks, function in extreme temperatures and to be moisture resistant. We build them according to MIL-STD-810 and MIL-STD-461 and put them through an extensive burn-in program before they leave our facilities to guarantee each unit can take everything that's thrown at it.

Hi-res and multifunctional

Your displays need to keep up with modern computing power. We offer hi-res screens with up to 20 megapixel resolution and options like PIP functionality to run multiple programs simultaneously, infrared touch screens and programmable hotkeys.

Plays well with others

The RD displays are compatible with most equipment thanks to their wide range of input and output options and flexible mounting solutions. They also have a long "form, fit, and function" period so you don't have to worry about upgrading any time soon. And no matter how long your displays are in use, you can count on efficient service as we offer lifetime support.

Endless customization options

We specialize in customizing our displays to your needs. Creating your own unique solution is a quick process with rapid prototyping and a short time to production. These projects usually include customized mounting systems, selecting functionality from our wide range of options and tailoring in- and outputs.

Operational advantages that give you an edge

From concept to creation

Specification

Upon receipt of a customer order a development specification is produced. This specification will ensure that both MilDef and the customer have a common understanding of the required deliverables.

The agreed specification is also the key document on commencement of a detailed design. The development specification is the backbone of the project and will be referred to and reviewed throughout the R&D process.

Design

After the development specification has been approved by the customer, the detailed design work may commence for the mechanical, electronic and software elements. All drawings, layouts, and specifications needed to produce the prototype are prepared

in-house with the support of the latest available systems, such as 3D CAD and PCB layout. Potential design solutions are continuously evaluated with a practice of "Upstream Design" ensuring that MilDef prototypes are in accordance with customer expectations.

Suppliers

MilDef works with both local sub-contractors and global vendors. Key suppliers include CNC (Computer Numerical Control) service suppliers, who machine chassis from single billets of aluminium,

SMA (Surface Mounted Assembly) suppliers, conducting the assembly of PCBs and selected vendors, supplying inter-connectivity solutions especially developed for the defence industry.

Prototype builds

Once suppliers have delivered the parts to MilDef requirements, these are processed through the R&D lab and prototypes are built. The prototypes are always assembled in co-operation

between the R&D engineers and production personnel. This ensures that a volume production perspective is gleaned from an early phase.

Prototype Verification and Validation

MilDef has its own test standard called the MilDef Verification Handbook, which details the minimal tests that are carried out on all prototypes. After prototype assembly, verification

and validation consist of functional, environmental and EMC tests, allied with inspection activities (more extensive testing can be provided on request).

Test Certificate

All tests and inspection activities that are conducted when verifying and validating prototypes are referenced from the requirements laid down in the development specifications.

After verification and validation, a report will be issued proving compliance with the development specification and customer expectations.

Finished Product

For short production runs or custom solutions, MilDef delivers the customer requirement after the prototype has been successfully verified and validated.

For volume products to be built by MilDef the development will continue until the item is verified for serial production.

Designing the solutions of the future

Not every challenge has an off-the-shelf solution. Many of the innovations forces around the world rely on today started out as customization initiatives. Whether it's a few tailored products or hundreds of units, MilDef can help convert a concept for a better solution into reality with speed and efficiency.

Such projects generally involve modifying computers and connectors, designing a space-saving setup and enhancing units with a huge range of accessories. MilDef is also capable of integrating data security solutions and tempest requirements. Every new unit is tested in an EMI chamber to ensure it meets all the required standards.

Innovation at work

Thousands of MilDef solutions are in operation around the world. The German Army is using 2,500 customized MilDef units in their FüInfoSys Heer battle management system. Airbus in France have equipped all of their A400 military transporters with portable maintenance access terminals (PMATs) built from MilDef III and RK886s. And MilDef recently helped the Norwegian Armed Forces create a compact and mobile communication solution using 19" units for their CV90's.

To help the Norwegian Armed Forces take control of the sprawling equipment in their CV90's, we created a compact solution based on 19" units. The solution houses all critical tech like computers, switches, UPS, etc. in one mobile unit.

Custom built solutions

MilDef Design House

MilDef offers its customers complete realisation of their product ideas or concepts. This is achieved by experienced and well-motivated personnel, who have

a clear understanding of what is required to convert a customer's idea into a finished product. MilDef focuses on cost, quality and time for both high and low volume products and solutions.

Efficient beyond line-of-sight (BLOS) blue force tracking

As military, police and government forces find themselves conducting operations across greater distances and with more autonomy from their higher commands, reliable and efficient blue force tracking is becoming a critical requirement for effective operations. By implementing the SCC TITAN system, commanders gain access to a complete and seamless operational picture, which allows them to quickly and precisely manage unfolding events. SCC TITAN provides a solution to lost or no communications at the tactical level.

SCC TITAN does not replace Battlefield Management Systems (BMS/C4i platforms) which are, in the main, radio based. It is a Beyond Line of Sight (BLOS) bolt-on that augments existing national systems and cost-effectively resolves the potential deficiency of lost or no communications at the tactical level in every military communications infrastructure and therefore guarantees Situational Awareness and Command and Control.

The SCC TITAN solution provides 3-way messaging functionality and consists of four components: the SCC Platform, SCC Tactical software, SCC Mobile hardware and MilDef rugged computers and special electronics. These components can operate independently, but when combined they provide an interoperable, affordable, beyond line-of-sight blue force tracking (BFT) solution with powerful configuration options.

All communications use a secure virtual private network and unique AES256 encryption into a standalone server solution. Satellite data is sent via a secure network offering no-weak-link, point-to-point encryption. By enabling the transmission and receipt of important information, simple but structured military reports, geospatial display of deployed assets at the tactical level, SCC TITAN ensures that Situational Awareness (SA) and Command and Control (C2) are maintained when tactical voice radio is unavailable. This ensures that commanders have the information they need to act intelligently whatever the voice communications situation.

SCC Platform

The SCC Platform is a secure server solution that enables full BFT for military, police and government organizations. It includes situational awareness, operational command and control, emergency response and the ability to provide comprehensive post operation debriefing.

Providing a single, shared tactical Common Operational Picture (COP) for up to 10,000 separate assets on land, in air and at sea, it allows commanders to conduct synchronized planning, control movement and rapidly respond to changing conditions.

By giving access to near real-time situational data it facilitates making faster and better decisions. Secure web protocols, password encryption and satellite communication links using the highest commercial point-to-point encryption ensure complete data security.

SCC Tactical

SCC Tactical is the mobile situational awareness component of the SCC TITAN solution. It is designed to be accessed on a tablet or laptop computer and is used in conjunction with the SCC Platform as a client-based standalone BFT solution. Using secure satellite communications, it allows tactical commanders to pass information to asset groups and/or HQ to ensure continuous secure operation, anywhere in the world.

SCC Tactical is designed to connect and operate directly with Wave and Echo – the primary personnel satellite tracking and command and control devices. Combining them with the SCC Tactical application allows field personnel total, beyond line-of-sight BFT and situational command and control, enabling tactical awareness, advanced communications capability and ultimate mission success.

SCC Mobile

SCC Mobile hardware is designed for asset tracking and basic C2 in the field. It includes portable communications and tracking devices that can be handheld or installed into vehicles, aircraft or ships.

The primary SCC Mobile device is the Wave, which can be used in conjunction with personnel and vehicles. When combined with the SCC Platform and SCC Tactical, it enables commanders to view their position in near real time, and pass this data into the COP. Our Echo device is the ideal dismounted device for soldiers and police forces, with basic functionality. Both Whisper and Echo are designed to be robust, rugged and waterproof. The SCC Pocket app allows for information such as positional data, messages and emergency alerts to be presented in real time on the SCC Platform. It enables commanders to quickly identify the exact location of personnel in case of an emergency and initiate effective response. The application can sit in a passive mode while staff are in lower risk areas so as not to use power or data but can be pinged for instant location in an emergency. The application is fully encrypted, allowing the device to serve as a secure communications channel between team members and back to HQ if necessary.

MilDef logistics system

Our logistics system includes tracking devices that increase your situational awareness by giving logistics the same mapping capability, operational picture and messaging possibilities as manoeuvre forces.
