- > Existing Application Enhancements
- > Technical Staff Augmentation
- > Customized Training Preparation and Delivery

Are you running an application with no support from an internal developer?

An Application Review is a complete business and technical assessment of an **Oracle EPM** application. During this short engagement, Alithya meets with business users, IT, and executives to gather information and obtain insight into business processes. Alithya then accesses the **Oracle** application to analyze all the various aspects, including data integration, database design, calculations, input forms, workflow, reporting, security, automation, testing, training, and documentation. The review includes infrastructure review of hardware and configuration of an application in the multiple environments in which it runs. The resulting solution is a comprehensive evaluation by our highly experienced application designers.

The Deliverable

After a comprehensive evaluation, Alithya provides the client with an Application Review Assessment document with best practice improvements:

- > **Performance** – speed up calculation, load, or query performance times within the application (e.g. optimized allocation calculations)
- > **Stability** – improve system stability, either in terms of improved expected system up-time or through improved recovery procedures (e.g. backups)
- > **Functionality** – provide business enhancements not currently present within the application (e.g. FICA wage limit calculation)
- > **Workflow** – improve workflow for both end users and system administrators

An action plan prioritizes these enhancements into short, medium, and long-term application enhancements. The final step is a translation of the action plan into a roadmap for delivery.

**Proven Partner for EPM, BI
and BD Solutions**
