

ProofID IGA[®]

ProofID IGA is an Identity, Governance and Administration platform, providing workflow driven, user-centric automation of your joiners, leavers and movers process. Designed to be quick-to-value, with a focus on out-of-the-box functionality, ProofID IGA is a cost-effective way to quickly take control of your identity lifecycle.

End-to-end identity lifecycle management

ProofID IGA automates the identity lifecycle from cradle to grave, managing users' access to applications and services throughout their changing association with the organization. Identity records can be synchronized from one of more authoritative sources, such as the HR system, into target applications ensuring that users have access to the application they need according to their role.

Role-based access control

With its role-based architecture, ProofID IGA allows the organization to map functional roles to digital resources, ensuring that users get access to the applications and services that they need according to their relationship with the organization, and further ensuring that access permissions are updated if their role changes.

ProofID IGA employs a multi-level approach to roles, layering 'birth right' access rights with more fine-grained functional roles, augmented by a third layer of self-service application catalogs.

Identity governance

Staying on top of who has access to what means checking regularly that access is still appropriate. ProofID IGA provides out-of-the-box workflows accommodating most common identity governance requirements including account approval and identity certification. Compliance scanning helps you to be sure that connected applications remain in compliance with access rules and policies.

Delegation and self-service

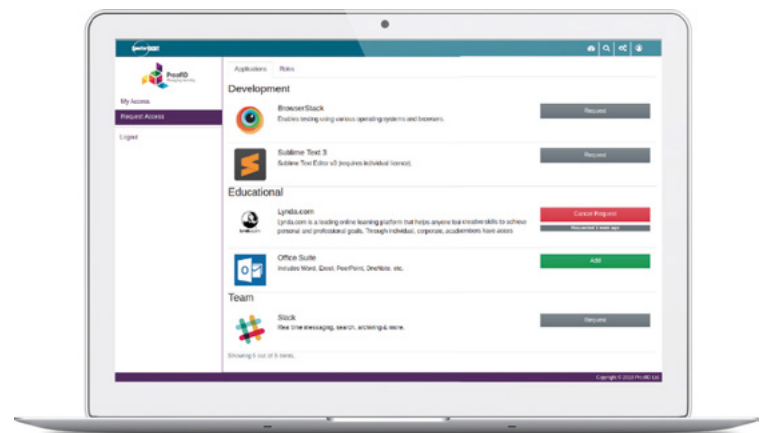

ProofID IGA provides extensive delegation and self-service capabilities, empowering users across the organization to manage and request access whether for themselves or on behalf of others – essentially bringing identity management tools closer to the users that need them, and helping the community to 'help themselves'.

B2B, franchise or collegiate models can be managed via delegated administration, while the identity portal allows end users to manage their access, and request additional applications and roles.

Getting started

ProofID IGA®

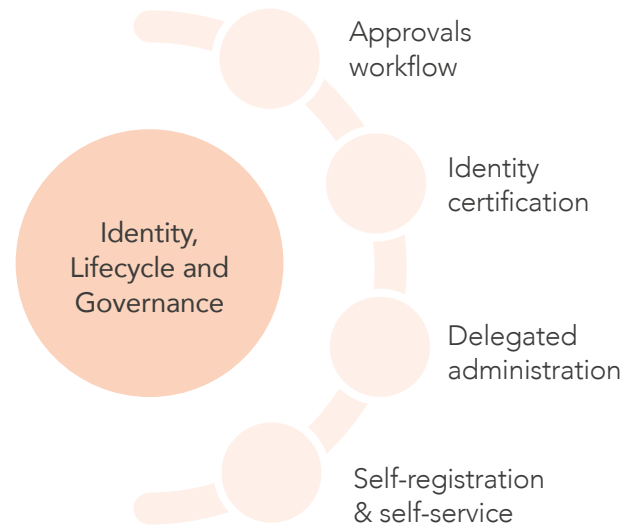

Key features

- **Identity lifecycle management:** Automate the identity lifecycle from cradle to grave, managing users' access to applications and services throughout their changing association with the organization.
- **Role-based access control:** Powerful role-based approach to modelling access, layering 'birth right' access rights with more fine-grained access aligned to functional roles.
- **Standards based provisioning:** Fully automated bidirectional identity provisioning engine built on the SCIM standard. Integrate provisioning workflows with legacy applications via the modular SCIM bridge which supports LDAP, JDBC and text as well as custom connections.
- **Identity governance:** Leverage out-of-the-box workflows accommodating most common identity governance requirements including account approval and access certification. Automatically detect and resolve anomalies and exceptions in connected identity stores and applications.
- **Delegated administration:** Support B2B and collegiate operating models by delegating administration of identities to departments or external organizations such as suppliers, subject to centrally defined policies.
- **Self-service:** Empower users with self-service workflows for account registration, profile management and password/username recovery. The identity portal allows end users to manage their access, and request additional applications and roles.

Benefits of ProofID IGA

- Take control of your identity lifecycle from cradle to grave
- Manage staff, contractors and external users in a single system
- Deploy quickly with out-of-the-box workflows
- Empower users to help themselves, reducing reliance on the helpdesk
- Satisfy internal audit requirements with compliance and governance workflow

How does it work?

ProofID is an IAM Managed Service Provider (MSP) operating globally. Our team of identity experts are trusted by many Tier-1 enterprises to design, deliver and manage their IAM services. We manage millions of identities and deliver services to over 150 countries. All successfully delivered through our methodology driven IAM Managed Service.
