HOFMANN LAUNCHES NEW TYRE AND WHEEL PACKAGES

The HOFMANN range of tyre changers and wheel balancers has been given a new look for 2016 with four tyre and wheel packages designed to meet varying levels of tyre changing and wheel balancing requirements that workshops face.

Ideal for businesses looking to take their first steps into wheel servicing is the Boxer package, which features the BB2200 tilt back tyre changer and BB4100 digital wheel balancer with 1D SAPE (semi-automatic parameter entry) to measure wheel offset.

The next step up from the Boxer package is an offer that pairs the geodyna 7100 digital wheel balancer with the new monty 3300 20 Smart tyre changer.

The geodyna 7100 offers a 2D SAPE to measure wheel offset and wheel diameter in one process, along with other advanced features such as the ability to hide weights behind spokes for a more appealing cosmetic finish, and it is perfectly complemented by the monty 3300 20 Smart – which comes equipped with the easymont assist arm to help make the tyre-changing process smoother.

Package number three pairs up the geodyna 7200 wheel balancer, with its 2D SAPE and intuitive control panel and video display, and another new tyre changer – the monty 3300 24 SmartSpeed.

The monty 3300 24 utilises built-in SmartSpeed inverter technology to control the rotation speed of the turntable depending on the torque required when mounting and demounting tyres.

Completing the new range is the combination of the geodyna 7600L (right, bottom) video display wheel balancer, which adds Smart Sonar to a 2D SAPE for automatic measurement of wheel offset, diameter and width, and the new monty 3300 SmartSpeed Plus tyre changer (right, top).

The 3300 SmartSpeed Plus comes as standard with the HOFMANN Plus Kit – which includes, among other items, a

plastic bead breaker disc, triangular bead pusher and a plastic tyre protector – and it also adds pneumatic tilt tower operation along with a racing chassis for easier and more ergonomic use by the technician.
