## **EDITORIAL ABOUT EMISSIONS EQUIPMENT FOR GARAGE & MOT PROFESSIONAL**

HOFMANN's market-leading geogas 3000 emissions tester provides the modern workshop with an expandable tool that can grow and develop alongside the business.

Tablet PC operation (as part of the complete ATL package or wireless upgrade) allows users to operate the entire emissions and brake tests remotely, and link directly to the DVSA test site (separate customer broadband connection is required).

The geogas 3000 includes a unique water trap feature to ensure that the unit keeps working, Bluetooth connectivity as standard for a cable-free work space, it warms up quickly and is ready for testing in seconds, and an optional upgrade means it can be incorporated into a HOFMANN four-wheel alignment system – producing extra revenue from the investment.

Available as a standalone gas analyser or as a combined unit with a wireless smoke meter and wireless RPM and oil temperature measurement, the geogas 3000 is driven by familiar Windows-based software and does not require any specialist training for users.

At the heart of the combined unit is a powerful, industry-standard PC, with a 21-inch flatscreen monitor providing the technician with clear and easily visible information, plus a laserjet printer.
