Using a **Transit Hub** to ship files

Destination Endpoint is associated with Transit Hub (TH), so **all** shipping to it is via TH

Source Endpoint initiates connection to Transit Hub

Destination Endpoint initiates connection to Transit Hub

| Source Endpoint | | Transit Hub | | Destination Endpoint |

Outbound only on port 4115

In **and** outbound on port 4115

Outbound only on port 4115

Source Endpoint ships files to Transit Hub

Cargo stored encrypted on Transit Hub, until all delivered (at which point the intermediate copy is deleted)
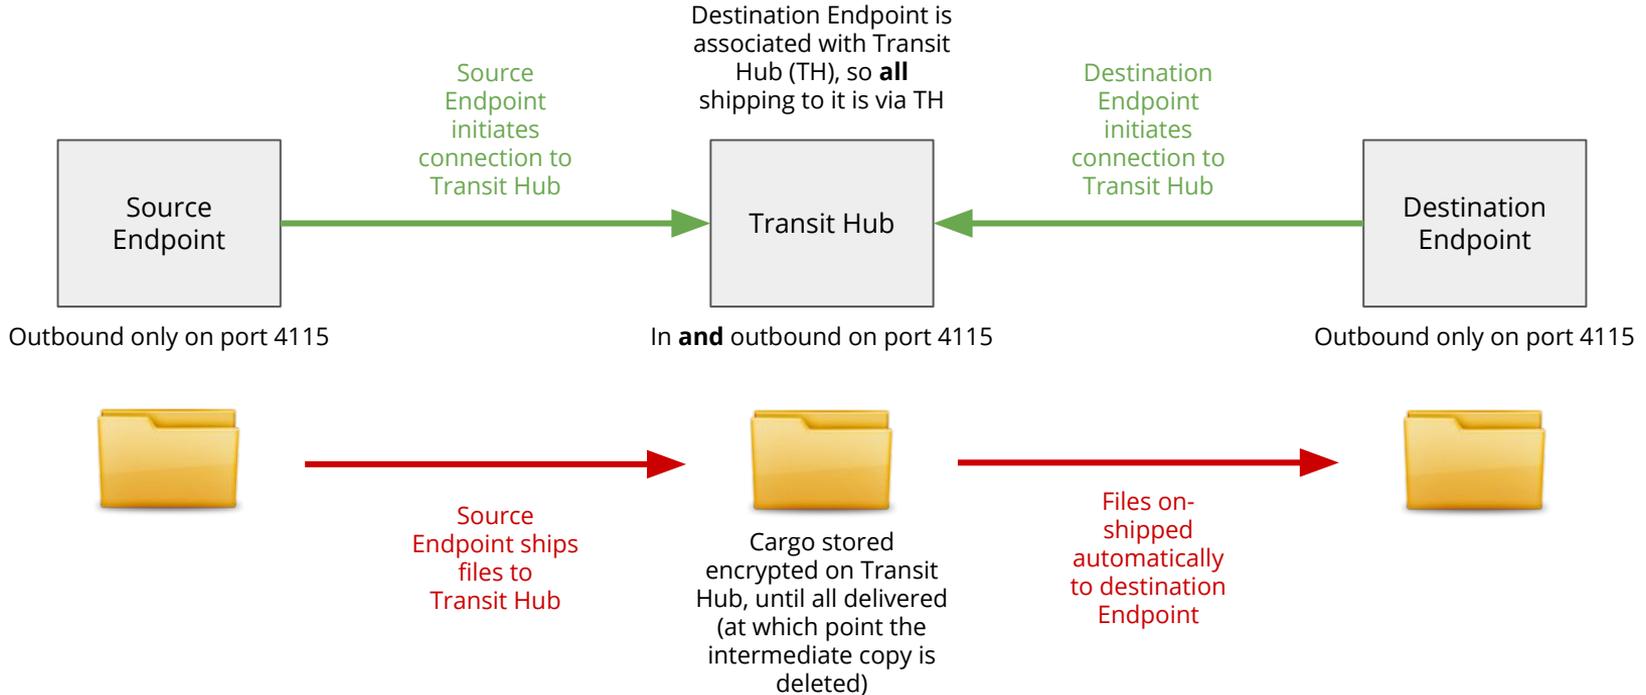

Files on-shipped automatically to destination Endpoint

This works for multiple source and destination Endpoints, all shipping via the Transit Hub (and for shipping both ways). Please note that Transit Hubs cannot be used when synchronising.
