

## Swimming Pool Tiles – White Crystal Japonais

White Crystal Japonais is a versatile material with excellent visual and technical characteristics. It is absolutely white (similar to top grade Thassos marble), harder than granite, effectively zero-maintenance for polished finish, and with a 0% water absorption rate.

Due to its excellent technical characteristics, it is suitable for a variety of applications, including heavy traffic commercial flooring.

In this project, White Crystal Japonais (honed finish) was used for the area around a residential swimming pool. It came in large panels, all in different sizes, as specified by project architects.

White colour can of course be combined with any other colour(s) inside and around a swimming pool. Glass mosaic in multiple colours, for example, is an interesting option.

That said, we recommend White Crystal in either polished or honed finish for the use inside swimming pools.

An extract from technical characteristics for White Crystal Japonais:

Specific gravity	2.7
Water absorption	0.02%
Diffusion reflectivity	85%
Radioactivity	No
