

Beat the winter blues

Alumasc Facades has manufactured a solution to untimely conditions that put pressure on build projects throughout the winter months with missed deadlines and increased costs.

The company says that, with constant unpredictability of the British weather, its new ST Mineral K render offers a solution that allows for work to continue during low temperature conditions.

Quicker than silicone setting times during winter months, give installers greater flexibility to apply the product in extended periods of bad weather, and it is touch dry in just a few hours.

Suitable for use across all Alumasc External Wall Insulation Systems and also for direct application onto solid walls, the product is lightweight, yet highly impact and weather resistant, whilst also remaining vapour permeable.

The product can be left with its original white finish without the need to paint, or alternatively can be overpainted with Alumasc's Silicone Facades paint which opens up a contemporary, wide-ranging colour palette.

The render has been created to tackle harsh conditions throughout the winter months

Ideal for both new-build and remodelling applications, it provides a breathable, flexible, weather-tight decorative finish to any building. Alumasc's ST Mineral K Render is eco-friendly, manufactured using only natural materials (mineral aggregates, and white marble grain) and is available with a rolled texture in 2, 3 and 4mm grain sizes, boasting Class 0 surface spread of flame. The product is manufactured under ISO 9001: 2008 and ISO 14001: 2004 Quality and Environmental Management systems and is fully BBA-approved.
