What is it?

The TS4 Tour Guard monitors the effectiveness of your security patrols, logging the dates and times guards visit specific locations via a handheld unit, and recording any missed clocking's.

How does it work?

The system uses a series of wall chips, placed at strategic points around a premises. By tapping the reader to each chip as guards patrol, and then downloading information in the reader to your PC, to maintain a complete picture of your security patrols.

Ideal for all locations, but particularly large manufacturing sites and hotels, Tour Guard ensures the patrols that keep your premises, property, staff and guests safe are constantly monitored, giving you complete security workforce vision, even when you're not around.

- *Unlocked door? Broken window? Use the Event Wallet to notify HR of potential issues/damage.*
- *Tag assets like fire doors or fire extinguishers on larger sites to ensure regular adherence to Health and Safety procedures.*
- *Each handheld unit can hold up to 7,200 clocking's. On low power consumption mode increases to up to 350,000 continuous reads.*
- *The handheld unit downloads data via the USB download unit to any PC running the supplied Tour Guard software*
- *Robust and water resistant handheld unit has a small, durable stainless steel body encased in a rubber shell with waterproof adhesive and no visible screws.*
