MonitorPro M

Bespoke Development

EHS Data fully integrates consulting and software and offers a full service to create your system and keep it running smoothly

Bespoke Development

Our experience makes us ideally suited to develop bespoke database driven web applications, including mapping and GIS elements.

Bespoke Development

The MonitorPro suite of products are highly configurable which greatly reduces the need for client based customisations. This means one code base for all clients and all clients benefiting from additional features and functionality developed for the MonitorPro community.

Our Team

The technical strength of our company is at the heart of our business. Our team have been recruited from not only in IT but also from environmental and technical backgrounds, and all have a long track record of using, administering and developing environmental and sustainability data management software.

Our developers are experienced in the specific fields of EHS data management, from waste management to contaminated land, mining and general industrial site monitoring.

This enables the company to develop highly relevant solutions and quickly understand our clients' needs.

All our development is completed by our experienced team and none is outsourced offshore, instead completed in the UK. Therefore where we need to develop specific features for MonitorPro to fulfil a specific requirement you're sure of an efficient and professional service.

Outside of the MonitorPro products, EHS Data also take on bespoke development. Our experience makes us ideally suited to complete bespoke developments around database driven web applications including mapping and GIS elements.
