Fire - Lynx

Fire alarm paging

LynxPro's **Fire - Lynx** System has been specifically designed to provide an instant fire alarm alerting device for the deaf and those who may be hard of hearing.

The **Fire - Lynx** transmitter is directly connected to the building's main fire alarm system and configured in such a way that should the fire alarm be activated a message is transmitted to a pager alerting the pager user of the emergency.

The pagers used by the **Fire - Lynx** systems are set in vibrate mode to provide a tactile means of alerting the user of alarm. On the pager screen the building name maybe showed identifying the exact location of the emergency.

Were the **Fire - Lynx** has been installed in a hotel, university hall of residence or sheltered accommodation the **Fire - Lynx** fully supports the LynxPro Nite-Alarm, waking and alerting device.

As you would expect of our company;

The **Fire - Lynx** system fully complies with the Wireless Telegraphy Act and with the relevant clauses of BS5839 2013 Part 1 (Clause 18) and Annex C.

Options (enquire for details)
