

Bathroom controller with 5 Sensor Pads being used on a stairwell – very much simpler wiring than using 2 way with intermediate switches.

The controller has a switched output using a relay rated at 500W. and will operate all types of lighting.

An “off-delay” timer version is available if a delay timeout is required.

A simple touch or close proximity approach will operate the switch.

Because extra Sensor Pads can be added easily, switches can be placed where it is most convenient.

Sensor Pads can be mounted behind faceplates of your own specification or design. These Sensor pads have no moving parts and are therefore less likely to be vandalised.

The Bathroom/Multiway Controller can of course switch or control other electrical devices such as call bells etc.

If in doubt please call us on 01548 511498. Please note that you should **always switch off power at the mains before performing any electrical work.**
