## THE NEW TWO-POST LIFT FROM HOFMANN

**The newest addition to the HOFMANN range of automotive lifts is the GLS 4 Multi – a two-post service lift with a clear floor design.**

The GLS 4 Multi has a 4000kg lifting capacity and also provides workshops with flexibility when it comes to deciding what suits their requirements best as it has two height options and two width options, allowing it to be fitted into existing space.

Features include a baseless design that allows for clearer access for technicians and movement of tools and equipment; four three-stage arms with a symmetric design, a manual safety lock release; availability in three-phase and single-phase options; a minimum vehicle clearance of 105mm; and a lifting range of 1900mm.

The GLS 4 Multi, which is ideal for general garages and multi-bay repair centres, along with independent garages and workshops, is part of the HOFMANN range of two-post, four-post and scissor lifts.

Dual revenue opportunities are provided to workshops with four-post and scissor lifts that can be configured for MOT/ATL operation, as well as wheel alignment work, meaning they can be bringing money to a business even when not being used for testing.

Both are available with 4000kg and 5000kg lifting capacities, and they are both suitable for normal service work too.

HOFMANN's scissor lifts also provide different options to workshops with the mid-rise version being a great investment for any busy garage owing to its small size and portability. The full height double scissor lift is designed for surface-mounted installation and brings features including a four hydraulic ram system for added safety and stability between platforms, and pneumatic safety locks.

HOFMANN also offers two-post lifts with 3000kg and 5000kg capacities, meaning there are options to suit all types of workshop requirements.
