

No-compromise security at any scale.

100% software.

100% simple.

As organisations around the world move to adopt broader access policies for a growing mobile workforce, they find themselves faced with a question: at what point should security be sacrificed for simplicity?

Apply Mobile has the answer: never.

Meet iDENprotect by Apply Mobile, providing powerful protection to secure mobile access. Simply.

Protection in a threat-filled landscape

It's a reality of modern business operations that more employees are demanding access to sensitive data at any time from any device. As companies expand their policies to allow wider mobile access, however, the threat landscape is keeping pace – making it harder than ever to protect even the most basic systems across the company network.

iDENprotect enables businesses to safely increase the availability of information, keep productivity high, and optimise processes throughout the workforce, no matter what device is used to access data.

The safeguard behind iDENprotect is Apply Mobile's built-in security architecture, underpinned directly to the electronic architecture on mobile devices themselves. This makes data security fully locked to the hardware users already carry with them, every day.

iDENprotect meets rigorous internal security policies set by organisations – and the legal and regulatory mandates for software. And with its simple interface, iDENprotect embraces the familiar user experience expected by mobile workers. All safely. No sacrifice.

Security in Software

iDENprotect is a software-based security tool, scalable to any number of employees, to manage and secure digital identities from within users' mobile devices.

It stores and manages credentials such as digital keys, certificates and passwords that can be used to provide secure access, protect data and authenticate users; then adds further layers of security to any third-party software for communication, data protection, encryption or banking transaction.

Granular control of any number of iDENprotect users can be centrally managed with Apply Mobile's iSPA management console, giving you highly scalable, full management of identities and access. For multiple levels of protection in more demanding environments, Apply Mobile's iDENtear® hardware can work in tandem, providing organisations with a cost-effective, rules-based way to manage authentication levels, while reducing administrative effort and costs normally associated with purchasing and provisioning authentication technology.

With iDENprotect, you have scale, simplicity and security to ensure success of your mobile strategy.

Product Highlights

No additional hardware. If regulations or security policies do not mandate a separate hardware device to provide security, iDENprotect is your real alternative. Strong software integrity and trusted security ensure your data remains safe and protected.

Key stored in device hardware to ensure the strongest possible security solution in software. Mobile security features upgraded? Even better: iDENprotect is anchored to its hardware and will strengthen along with them.

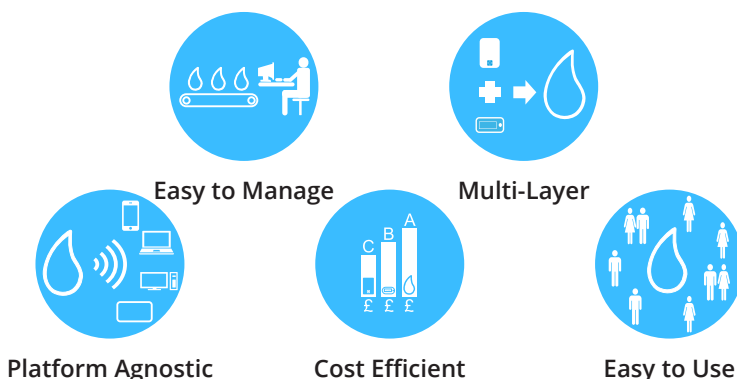

Protects off-line data at rest on mobile devices, combining simple PINs with the biometric fingerprint sensor on the mobile device – so you can securely support a “bring your own device” (BYOD) strategy and not put confidential data at risk.

Integrates with leading Mobile Application Management solutions –so you can arm employees and staff with the BYOD device protection they need.

Securely manages the credentials that can be used to decrypt or sign emails on a mobile device, digitally sign documents and support non-repudiation – so you can transact secure communications effectively and securely via mobile devices.

Scales with your workforce without requiring additional investments in purchasing and provisioning hardware authentication technology.

Keeps security simple with no burden on mobile users, who don't want to carry additional authentication hardware, want to access the necessary data for their jobs from wherever their devices allow, and can do it all with a simple, mobile-friendly interface – no long and complex passwords.

About Apply Mobile

Apply Mobile standardises security in a digital world through Innovation and Integrity. The patent pending iDENtear device, iDENprotect and iSPA products are designed to integrate with a variety of computing platforms, including laptops, with a particular focus on mobile devices such as phones and tablet devices. Regulated, blue chip, government and defence clients use our technology to simplify security, reduce costs and enhance productivity.
