IMMUBOOST ADVANTAGE CALF START

ImmuBoost Advantage Calf Start is an easy-to-use, complementary milk additive. Containing a unique blend of ingredients, **ImmuBoost Advantage Calf Start** advances the development of the rumen and promotes increased growth rates. Designed through research and developed by the Nutribio technical team to aid in maximising the animal's genetic potential assuming good management practice. Research indicates that improving the development of young replacement stock has shown to have lifetime benefits in the form of increased milk yields, improved immunity and greater longevity within the herd.

Maximising growth rate is essential for heifers to be able to calve at the correct weight at 24 months. Research shows that the cost of rearing a heifer doubles when a replacement heifer calves at 36 months compared to 24 months.

The ImmuBoost Story

ImmuBoost Advantage Calf Start is the newest member of the ImmuBoost family and is the first offering from our new ImmuBoost Advantage range. The ImmuBoost brand stands for a range of products that help to boost animal performance and farm profitability. The success of the range lies in the fact that all formulations are based on extensive scientific research of the key issues that optimise the targeted animals performance and profitability. In order for a product to be included in the range it first needs to meet a number of strict criteria including proven immunity boosting properties and delivering superior results.

The range began with a single species focus (cows) and has now extended to include sheep and calf products. All products in the range offer peace of mind to the farmer that the particular requirements of his animals are being met and that he will have a more productive and profitable animal overall.
