POZZI INDUSTRIES

DIP PRINT - production steps

The pattern or design is printed on a water soluble film that it is layed on the water surface in the immersion tank.

The film is specially treated to activate the inks. The film is activated by an autonized Patented Activator, release by high pressure guns.

The film is floated out onto the water and the product to be decorated is pressed down into the film to effect the transfer.

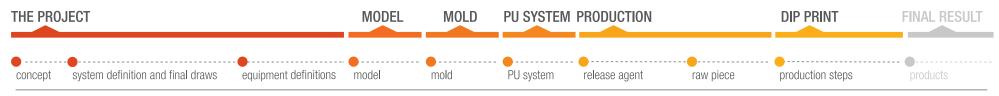

Having fulfilled its role as the medium for the print transfer, the film is washed away.

Water which has adhered to the product (material) during transfer is dried off.

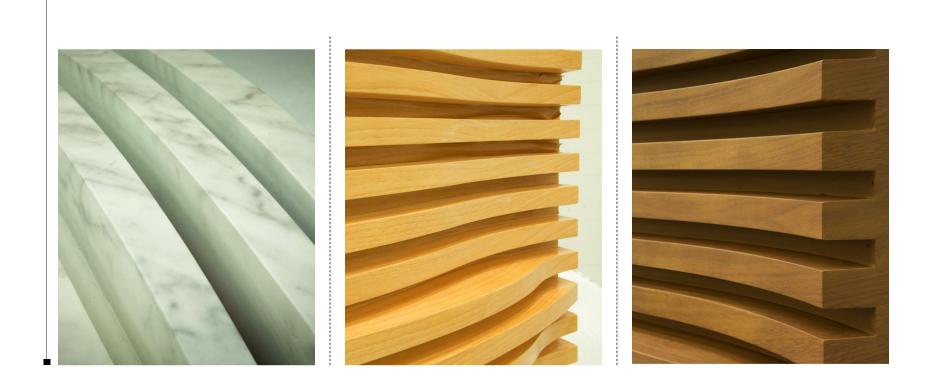

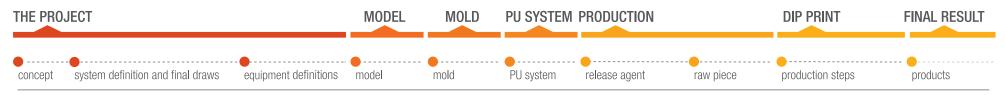

FINAL RESULT
