

Extend the life of your MVHR system through regular servicing

Your heat recovery ventilation system is a lifetime investment. Serviced regularly, it will ensure your property receives a constant flow of fresh filtered air and provide you with a healthier indoor environment.

Servicing will not only increase your system's life span, it also plays an important part in its effective day-to-day operation. The filters within the unit can soon become blocked and may, over a period of 6-12 months, start to degrade which could in turn jeopardise the effectiveness of your system. In addition to your annual service, we would also recommend that you check your filters every three months to safeguard their performance. If they are found to be excessively dirty, we suggest that they are removed, cleaned and replaced in accordance with the manufacturer's instructions.

Cleaning the heat exchanger

Replacing the filters

A typical service* carried out by one of ADM's competent service engineers involves:

- Replacing the filters
- Cleaning the air valves (where accessible)
- Removing and cleaning the heat exchanger
- Cleaning inside the unit
- Checking and cleaning the fan impellers
- Checking the system for satisfactory operation
- Re-balancing the system
(optional – an additional charge will apply)
- Visual inspection of external grilles
(Subject to safe access closer inspection is possible but an additional charge may apply)

**Please note: our standard servicing charge does not cover the cost of surveys or remedial works. If you are having operational issues with your system please provide us with full details and we will be pleased to quote accordingly.*
