

Rapid, fixed-price performance and scalability testing for web-based applications

Delivered by our expert testing consultants using our own enterprise-class Web application performance-testing tool **StressTester™**, WebLoadTest™ will tell you exactly how your application will perform under load. Simulating real-life scenarios and load variables as well as pinpointing the underlying causes of any problems that arise, WebLoadTest™ will deliver a detailed evaluation of the application's performance typically within one week from the start of the engagement.

When to use WebLoadTest™

WebLoadTest™ addresses the challenges facing web application development teams who are increasingly working to commercially critical deadlines and tight budgetary constraints. When the business is pushing to move the application from development to production, WebLoadTest™ will ensure projects stay on schedule while providing the verification needed for confident release into the production environment.

Often the only alternative to a WebLoadTest™ is several weeks of test-script development using expensive, frequently unavailable, scripting experts. Using this approach can mean serious delays to the delivery of business critical applications and can often result in a significant negative financial impact on the business.

Due to the speed of delivery, WebLoadTest™ enables performance testing throughout the application development process, even during short Agile Sprints.

What applications can be Tested?

StressTester™ works across the full spectrum of web technologies including HTTP(S), PHP, J2EE, SOAP, .NET, ASP, and AJAX. More protocols are being added on a frequent basis; please contact us for the most up to date list of supported technologies. In addition, many leading ERP systems have been successfully tested including:

IBM Maximo, SAP, Oracle and Microsoft SharePoint.

Who uses WebLoadTest™

WebLoadTest™ has been delivered successfully for hundreds of different web applications ranging from some of the most frequently visited public Internet sites to corporate Intranets and ERP applications. We are proud to count many major global enterprises, financial institutions, world-renowned universities, and well-known online retailers as our customers.

redefining standards

Accurate and quick results

WebLoadTest™ is delivered using Reflective Solutions' innovative testing tool, StressTester™. Enabling simulation of unlimited numbers of virtual users, WebLoadTest™ will accurately test the performance of the application under the same varied user load patterns likely to occur once it has been released into production.

Because there is no scripting requirement, testing is completed in days rather than the usual weeks needed when using alternative tools. This means that resources can be focused on the test outcome rather than wrestling with the complexities inherent in other tools, ensuring that the results need not be compromised due to lack of time or budget.

ACCURATE AND RELIABLE RESULTS

- Enterprise level, proven testing tool
- Expert testing consultants
- 100% correct and realistic tests

COST EFFECTIVE AND AFFORDABLE

- Competitive fixed price
 - NO hidden extras
- Unlimited virtual users
 - NO extra costs

QUICK DELIVERY AND ANALYSIS

- Projects completed in one or two weeks
- Detailed report & analysis

Augmenting in-house teams

Frequently, our customers use WebLoadTest™ to augment their own in-house test teams. This can be for a number of reasons, including situations where the existing tool license does not allow for the required level of testing, or when deadlines are looming and the testing team is fully engaged on other projects.

Alternatively, some customers take WebLoadTest™ as a regular outsourced service rather than buying a performance testing tool and employing their own in-house testing teams.

Whatever the motivation, clients are guaranteed an excellent service. Delivered by expert testing consultants, using an enterprise-class testing tool, WebLoadTest™ is used to guarantee the performance of some of the world's busiest and most complex Web applications.

How much does WebLoadTest™ cost?

WebLoadTest™ includes all the software licenses and consultancy services to correctly performance test any web-based application with no limit on the load simulated. **There is no additional cost whether the test requires 1,000 or 100,000 virtual users.**

The deliverable is a detailed engagement report including expert commentary based on experience gained through hundreds of engagements we deliver every year.

WebLoadTest™ projects can start from as low as £8,000 with the average engagement delivered for under £11,000.

Pricing can vary depending on the complexity of the tests such as projects requiring multi-location load injection to simulate different geographic traffic patterns, have high numbers of business transactions or need periods of extended soak testing. Whatever the requirement, the price is agreed and fixed at the outset with no hidden surprises at the end of the project.

Compared to the alternative methods of testing (or indeed taking the risk of not testing at all) WebLoadTest™ is a highly cost-effective means of ensuring that new application releases perform as intended.

About Reflective Solutions

Reflective Solutions is a performance testing tool and services company headquartered in the UK with offices in Boston, USA and Sofia, Bulgaria. Established in 1998 the company provides a range of software testing and monitoring tools and professional services. Reflective's flagship product, StressTester™, is the first enterprise-class 100% scriptless performance testing tool that significantly reduces the time and cost associated with performance testing. Industry experts tell us that StressTester™ is the only performance testing tool that is fast enough to be used in the development phase of Agile projects without delaying timescales.
