BETA consistently strives to provide high quality mapping products that allow communities to view their data in multiple outlets. Our GIS & Asset Management team's diversified tabular reports are embellished by utilizing GIS mapping technology to display data. BETA has developed highly intuitive, user-friendly, and web-based dashboards through ArcGIS Online (AGOL). This offers the ability to access system-wide trends and localized areas of need quickly and effectively for the purposes of project planning considerations.

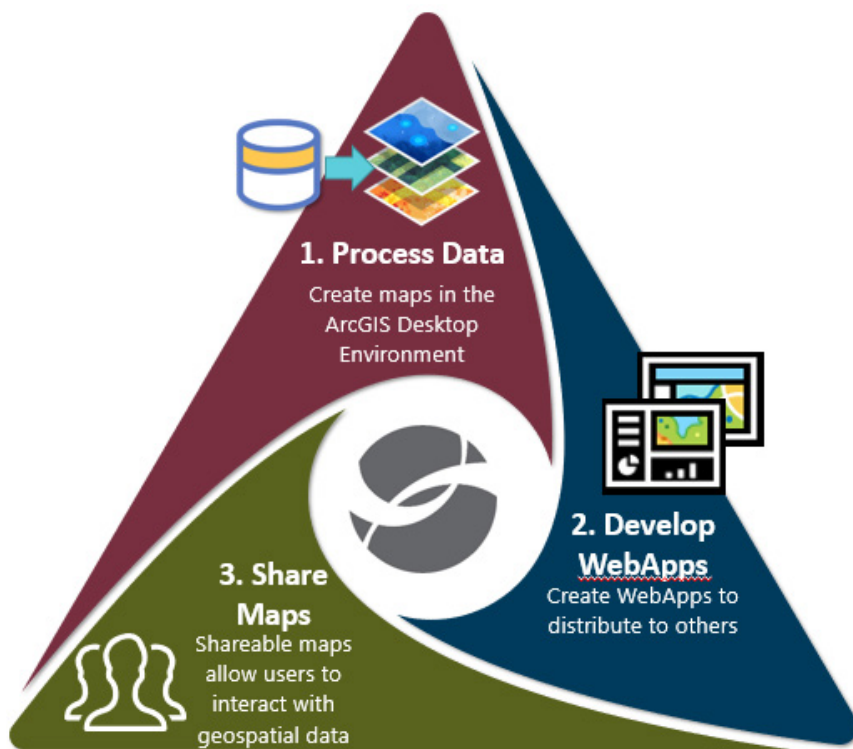

# Needs Assessment Approach & Process

BETA offers a proven methodology for assisting organizations, communities, and state entities to increase GIS efficiencies while producing a significant cost savings. This methodical approach helps departments reach the desired state of productivity by optimizing organizational operations and protocols. This is achieved by evaluating assets and records and providing recommendations based on our analyses. A significant cost benefit can be accomplished by identifying key areas where redundancies occur, workflow bottlenecks exist, and technological disadvantages appear. From there, strategies can be employed to correct inefficiencies to save time and money.

## GIS Capabilities

Accuracy is at the heart of any GIS dataset, and BETA has made the investment to provide GPS capabilities. We offer the latest in GPS technology to bolster our data collection process. With three Leica GPS units in-house, BETA can provide sub-centimeter horizontal and vertical accuracy.
