EASE STUDY

The fire station, based on the banks of the UK's largest canal, the Grand Union in North London since 1958, had senselessly had their existing generator stolen from their premises and due to the nature of the building, back-up power is fundamental.

Understanding that this was a time critical job, our projects team were quick to source a like for like replacement 10kVA mobile standby rated generator with wheel kit. Once received, pre-delivery inspected and branded, our projects team arranged for the speedy delivery of the generator to the fire station along with 30 litres of fuel.

Our generator engineer was on site to meet the delivery to install and commission the new generator guaranteeing that no time was wasted getting the fire station up and running again. Within 1 hour of delivery, our generator engineer had the set online and working.

On completion of the successful installation and commissioning of the new generator, power to the station was fully restored and we said goodbye to a very happy end client who was able to send their brave firefighters off to work with a nice cup of tea!
