GLASS

Sandblasting is the precision method of propelling very fine sand particles at high velocity on to the glass surface. This can be used for everything from a total frosted look to **simple borders, fine text** (including house names), **company logos, floral** or **abstract** designs... essentially, **anything** the customer may be able to imagine from traditional pieces to more edgy, **contemporary** designs.

The whole process is completed in house, from the stencils (created using the latest CAD software), through to the final product. Finished pieces can also be protected with Clearshield technology. This prevents smearing and the build up of fingerprints, watermarks and lime scale.

Sandblasting is a hugely versatile and effective form of glass decoration. Please contact us to discuss design possibilities or any ideas you may have.
