NETWORK MONITORING

A dependable network is vital to your organisation, but changing work styles, data-hungry applications and ever growing cyber-threats make network monitoring and management an increasingly complex, but unavoidable task.

Your IT network is essential to your people and the way they work. It impacts your customers too, and the way your business is perceived. It only takes one failure or breach to put your reputation in jeopardy.

An effective network supports today's work-styles: mobile, Bring Your Own Device and flexible access for staff and clients. It also provides web access and external connectivity. But, if it isn't monitored, the resilience and protection you so carefully designed will be of no value. You won't know when components fail or when security is at risk. Sophisticated, predictive failure reporting can't add value if the advice isn't heeded.

EnablesIT provides 24/7 monitoring and management using a portfolio of tools, available as a standalone service or as part of a wider range of managed services.

Network monitoring and management enables us to anticipate and resolve issues, before they become problems.

KEY FEATURES OF NETWORK MONITORING INCLUDE:

- Part of our end-to-end network capability
- Bespoke network management system successfully managing thousands of user end-points
- Round the clock, 24/7 network monitoring enables issues to be dealt with before they become problems
- Threshold breaches, component failure or service degradation monitored and resolved
- Extends to monitoring of additional critical devices on the network
- Industry standard tools and reporting

BENEFITS:

- Enjoy peace of mind with 24/7 networking capability
- Proactive management to ensure maximum availability
- Ensure your network is available for business as designed and intended
- Protect your business reputation
- Enable efficient staff working
- Management information for informed service improvement
