The recommendations are only guidelines based on grow room air temperatures of 20°C-25°C and a relative humidity of 50-65%. The conductivity of the nutrient should be maintained at the higher end of the guide for temperatures closer to 20°C and/or a relative humidity toward 65%. Conversely, the conductivity of the nutrient should be maintained at the lower end of the guide for temperatures toward 25°C and/or a relative humidity of 50%. If the grow room temperature is higher or the relative humidity is lower than the recommendation then reduce nutrient strength further.

Sumo Boost can be used as a foliar feed to further enhance its impact. Follow direction in above charts and foliar feed just once per week in the indicated weeks. CalMag can also be used as a foliar feed to correct deficiencies relating to poor establishment or environmental problems. Use once per week at 15mL/L until the issue is resolved.
