HortiMaX MiniMaX

- Small enough to fit inside your pocket (6x10cm)
- Features a clear colour display and reliable wireless network
- Lets you scan benches, paths, containers, etc.

Maximum Results with Minimum Effort

This handheld input terminal developed by HortiMaX makes it a breeze to enter labour and harvest data. All data are available in real-time and instantly update you on the progress of activities, costs, worker performance, harvesting and quality. As a result, your operational processes will be more transparent and easier to manage.

Easy to use

The MiniMaX is a breeze to use thanks to its clear colour display, five-button controls and scanning capability. To enter data, one of your workers simply selects an icon or text on the display and presses the OK button. After completing an activity, a worker is able to select it on the display in his/her native language. If the terminal is connected to the server, the display will then instantly show the worker's productivity in plants per hour or pieces per hour, for instance. This feedback helps boost the motivation of your workforce considerably.

Fast and error free

Since the MiniMaX also allows workers to scan the RFID tags of paths, tables, containers or harvesting trolleys, inputting data is fast and error free. Information is transmitted via an industrial wireless network that has more than proved itself in the horticultural industry. If the MiniMaX is out of range and the connection is lost, the device has a sizeable internal memory to store data for transmission later. The battery is recharged at night by plugging the unit into a USB port or docking station. The MiniMaX input unit is sold as an alternative to the traditional terminal network and is used together with the flexible HortiMaX Productive software.

HortiMaX Productive

The MiniMaX can only be used in combination with Productive, HortiMaX's latest generation of labour and harvest registration software. This new software incorporates the knowledge acquired from P-Plus registration systems, covering a total area of more than 1000 ha of protected horticulture. Similarly to P-Plus, Productive allows you to reward or penalise workers based on their performance and quality of work in time off, money or points. This software, along with the MiniMaX, will pay for itself in a short period of time – in some cases, even within a year. And this is not limited to large businesses or businesses with student workers.

HortiMaX Productive is highly suitable for use in the ornamental sector and includes the following benefits:
• Lets you input crop and batch data
• Lets you create custom tables or graphs
• Can be interfaced with sorting machines and third-party software
• Allows data from different business locations to be combined
