## Pet food preservatives are harmful.

## It's a myth

Some consumers believe that preservatives are unsafe ingredients that shouldn't be added to foods for humans or pets.

## The facts

Preservatives are added to ensure pet food remains wholesome and nutritious during distribution and storage.<sup>1</sup>

- Preservatives called antioxidants are added to commercially prepared dry foods to help prevent spoilage and breakdown of nutrients.
- The preservatives used in Purina® pet foods are the same ones approved by the FDA for use in human foods.

Fats, proteins and vitamins are the critical nutrients that require preservation during storage.

- Fats may break down during storage if not properly preserved.
- Antioxidants guard against oxidative destruction of fat and other nutrients to help preserve the nutritional quality of the food.

Preservatives or antioxidants can be categorized into two basic types: natural antioxidants that are derived from nature and synthetic antioxidants.<sup>2</sup>

- Natural antioxidants are found in certain grains, vegetable oils, herbs and spices.
- The most effective and commonly used natural antioxidants are mixed tocopherols (vitamin E compounds) that are primarily obtained from soybean oil or other vegetable oils.

- Synthetic antioxidants are more effective and stable than natural antioxidants.<sup>3</sup>
  - Synthetic antioxidants are 5 to 10 times more effective than natural antioxidants.
  - They are more stable and better able to withstand the heat, pressure and moisture used during cooking.
  - Because higher levels of natural antioxidants are needed, they are sometimes used in combination with synthetic antioxidants to provide an adequate level of protection.
  - Some of the FDA-approved synthetic antioxidants commonly used in both human food and pet foods include BHA, BHT and TBHQ. These have been proven safe for use in the approved amounts.

## Remember

Given the proper information, you can confidently choose foods for your pets that are properly preserved, safe, and provide the guaranteed nutrient content and quality throughout their shelf life.
