

Commercial

- Aish can provide a complete in-house solution to most requirements, utilising our engineering department, programme management and comprehensive manufacturing facility.

- An innovative approach allows the development of products from basic concepts to fully specified equipment.

Here are some examples of Aish innovation:

Data recorder

Aish has developed a protective capsule to house the recording medium for a Voyage Data Recorder.

We developed, designed and manufactured a protective capsule to protect the delicate electronics within, from the extremes of heat, impact and pressure.

Our capsule protected the PCB's from a 250kg impact from a height of 3m; it was heated in an oven at 260 degrees for 10 hours, inserted into a furnace at 1100 degrees and finally it resisted the pressure of sea water at a depth of 6,000m.

Our design is currently the only protective capsule in the world to meet the requirements of the International Maritime Organisation legislation for Voyage Data Recorders.

Inca Console

This photograph demonstrates a new generation of console for Aish; compared to the traditional focus towards ruggedisation and environmental protection.

The primary consideration was the look and feel of the console, along with the need to produce it to a limited budget.

Each of these parameters has been achieved with the resulting console complementing the system requirement.

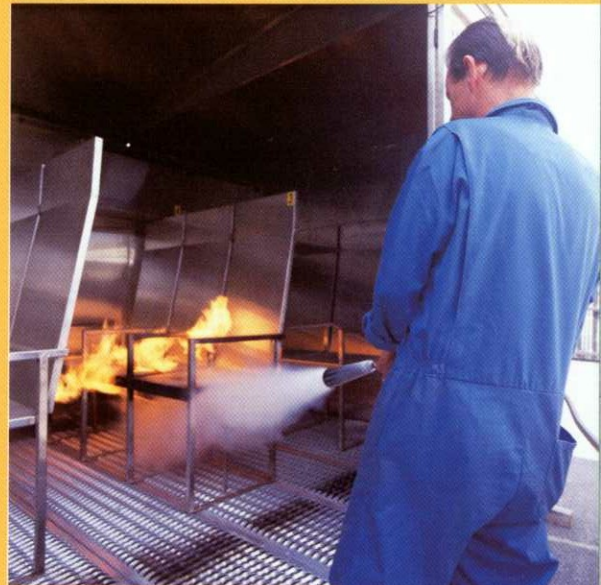

Live Fire Training Units

Our in-house flexibility allows us to work with one of the worlds leading manufacturers of live fire training scenarios.

The unit shown is an aircraft cabin crew trainer, which is 5m long, 3m wide and 2.5m high.

This unit creates a range of fires, from seat and over head lockers to galley and W.C.

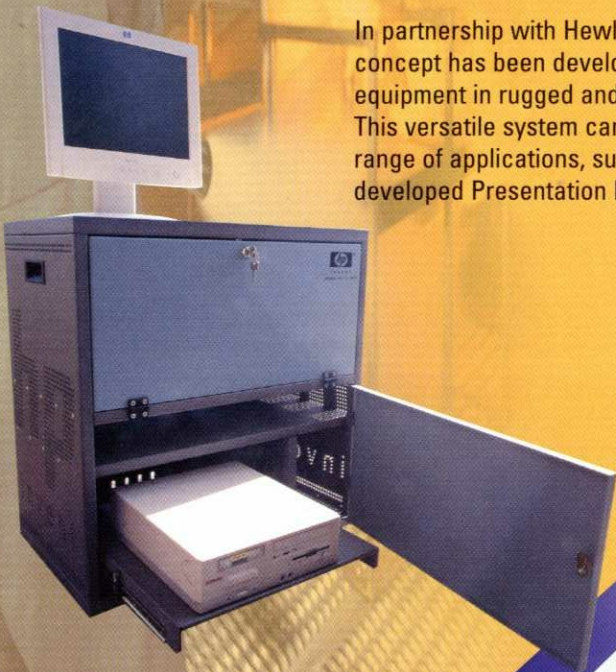

To complement the range we manufacturer smaller units for fire training consultants, local authorities and the fire service.

Office in a Box

In partnership with Hewlett Packard, a new concept has been developed to house computer equipment in rugged and secure enclosures.

This versatile system can be applied to a wide range of applications, such as the recently developed Presentation Room in a Box.
